TABLE OF CONTENTS

Introduction

Part 1

 Section 1 Figures Information

 Section 2 General File Information

 Section 3 PL/1 Declaration Statement

 Section 4 Detailed Record Layout

Part 2

 Section A File Content

 Section B File Sequence and Geographic Definitions

- 1) Sequence of 1981 Census User Summary Tape Files
- 2) Geographic Definitions

 Section C Geographic Organization

 Section D Supplementary Information

- Confidentiality and Random Rounding
- Sampling and weighting
- Data Quality
- Geographic Reference Products
- Reference Products

 Section E Special Notes

INTRODUCTION

DOCUMENTATION FOR CENSUS DATA ON MAGNETIC TAPE

This documentation is divided into two parts.

Part 1 is available for any tape file produced from the census micro-data base using the STATPAK retrieval system.

Part 2 is available only with census User Summary Tape files and special requests on tape produced by the Customer Services Section.

Part 1

Introduction

In the following documentation each tabulation is referred to as a data matrix. Each characteristic or variable such as age, sex, etc., is referred to as a dimension or subscript. Each dimension is associated with multiple entries; for example, the dimension sex could be associated with entries male, female, total.

Part 1 consists of four sections

Section 1 shows:

- that each data matrix has a title associated with a matrix name. The latter is a mnemonic code up to eight characters long. The documentation usually refers to a tabulation by its mnemonic code;
- the total number of data cells in a matrix;
- the largest absolute value of any cell in the matrix which may be used for data validation and programming purposes.

Please Note:

The cells contain either integer or decimal digits with decimal point which is implied.

If overflows are encountered, the overflow messages appear in the first section and when the program interrupts, the other sections may be either partially or not at all printed.

Section 2 shows:

- the general file information enabling computer usage of the file.

Where necessary a matrix may be written out on more than one logical record. In that case, the dimension(s) (variable(s)) on which the matrix is split is (are) identified as well as the order in which the matrix is actually written out on magnetic tape.

Section 3 contains:

- a PL/1 declaration statement - this statement should be of special interest to users who wish to understand how a multi-dimension matrix (e.g., age by sex by marital status is a three dimensional matrix) is laid out as a linear sequential record on magnetic tape.

Each logical record starts with a 52-character geographic identification (see Section B). In the case of a matrix that is split and thus written over multiple records on tape, it is followed by sub-matrix identification(s), matrix name and matrix size. Then come the entries for each dimension (subscript) of the matrix.

Section 4 contains:

- a detailed record layout of the file;
- the identification part which is the same as on the PL/1 declaration statement (see Section 3);
- the content of each cell or field associated with the matrix name to which it belongs, the format, the first and last positions of each field in the record, the number of bytes (1 byte = 8 bits = 1 or 2 digits or 1 character depending on the format), the precision or number of digits stored and the scale where applicable, which gives the number of decimal places. (Note: The decimal point is implied - not written on tape.)

Part 2

Section A contains:

- the table titles;
- the legends (entries or class intervals associated with each variable, e.g., sex (3): male, female, total).

Note: This section is available only with the census User Summary Tape documentation.

Section B contains:

- the file sequence and the complete definitions of the geographic area codes which exist on the file.

Section C contains:

- the geographic organization of the User Summary Tape files and microfiche for each series produced for the 1981 Census.

Section D contains:

- a brief description of the statistical and confidentiality methodology used during the process of retrieval of data from the census micro-data base;
- a list of reference manuals which provide more detailed information on some of the topics briefly described in this documentation.

For further information, please contact:

CANSIM DIVISION
Statistics Canada
Ottawa, K1A 0Z8
Tel.: (613) 995-0097
995-7406

Special Note: Positive or negative sign

If the character mode is packed, the last four (4) bits of the last byte of a data cell contain the sign.

If the character mode is numeric (external), the complete first byte of a data cell contains the sign.

Section E contains:

- information on any peculiarities related to geography or variables that are essential to the interpretation of data.

SECTION 1

FIGURES INFORMATION

File Name: SDE81B40 (Part 1)

Largest Absolute Value: 18,609,280

SECTION 2

GENERAL FILE INFORMATION

Formats: ZONED

The File Name is: SDE81B40 (Part 1)

The Data Control Block is:

The Record Format = FB

Logical Record Length = 3,022

Geographical Identification = 52

Data Cells Length = 2,970

The Blocksize = 9,066

Number of Cells for Each Record = 330

Total Number of Records Written Out = 4,842

For area B there is likely also a response error with the same direction of misclassification as for area A. The adjusted 1981 counts can be expected to contain some amount of error, but because the data are much less inconsistent (than those for area A) the data can be used with much greater confidence.

For area C there are discrepancies, but these may be caused by a combination of problems. For this area the 1981 count of total occupied dwelling stock is 226. The adjusted 1981 count of total occupied dwelling stock is 231. Thus the majority of the apparent differences must be due to reasons other than response error. The most plausible source of the differences will be the Period of Construction data (see (a), (b) and (c) under Possible Reasons for Differences), although the conformity of the 1976 and 1981 geography should be verified.

For area D there are no differences and the data can be used with confidence.

It should be noted that collapsing of Structural Types, as in the illustration, should be done whenever possible as it is easier to assess the cause of differences for large cells. It should also be noted that shifts in the counts for Movable dwellings are very difficult to assess. These dwellings may have a higher than average demolition rate, they can be moved out of or into an area, and they can be converted perhaps more readily than other types of dwellings.

As part of the investigations which have resulted in this cautionary note, the above procedure was carried out for a sample of geographic areas. The results for a sample of Census Metropolitan Areas, as an example, showed that significant response error was isolated to specific municipalities, that for the majority of municipalities there was no identifiable data quality problem, and that where response errors apparently did occur, the shifts by Structural Type were immediately evident.

Further information on the quality of the Structural Type data will be included in Data Quality - Total Population (Catalogue No. 99-904).

Type of Household Data

Due to a change in the method of determining family type, implemented for the 1981 Census, caution should be used in comparing the distribution of primary and secondary families with data from previous censuses. Since the delineation of type of household is dependent upon family type, the same caution should be exercised in comparing the 1981 data for secondary family households with the corresponding figures in previous censuses.

An explanation of these changes, and if applicable, the impact of such changes on the data for household type in general, will be included in the Summary Guide - Total Population (Catalogue No. 99-902).

Zero Cells

In User Summary Tapes and microfiche, a cell containing a "zero" value may represent any one of the following:

- (1) nil or zero.
- (2) figures not appropriate or not applicable.
- (3) median could not be calculated as it occurred in one of the open-ended classes in the distribution.

Due to the method of production it was not possible to use the standard symbols normally used in publications.

- (d) Since tabulations being checked will be for occupied dwellings, differing vacancy rates for the 1976 and 1981 Censuses would result in a corresponding difference in occupied dwelling stock counts.
- (e) Demolitions between the two censuses will cause the adjusted 1981 Census counts to be higher than the corresponding 1981 Census counts.
- (f) Conversions (e.g., converting a Single Detached to Apartments) may legitimately result in a decrease in the count for one dwelling type and an increase in the count for another. Generally such conversions should not have been reported among the new construction.

All of items (a) to (f), with the possible exception of sampling errors, should individually manifest themselves by way of a difference in the estimated total occupied dwelling stock for the area (comparing the 1981 total with the adjusted 1981 total). Collectively there may be a cancelling effect (e.g., demolitions and conversions). These will also cause changes in the counts for particular Structural Types.

As a possible source of differences, response error will manifest itself not by a difference in estimated total occupied dwelling stock but by a shift in the count of dwellings between two or more Structural Types. If there is a major response error the shift will be obvious. The following hypothetical example will serve as an illustration.

Comparison of 1981 and Adjusted 1981 on Occupied Dwellings by Structural Type

| Area | Apartments (000's) | | Other Multiple (000's) | | Single Detached (000's) | |
|------|--------------------|-----------|------------------------|-----------|-------------------------|-----------|
| | 1981 | Adj. 1981 | 1981 | Adj. 1981 | 1981 | Adj. 1981 |
| A | 260 | 361 | 130 | 30 | 20 | 19 |
| B | 385 | 400 | 53 | 40 | 10 | 8 |
| C | 150 | 155 | 36 | 35 | 40 | 41 |
| D | 78 | 78 | 24 | 24 | 56 | 56 |

For area A there is a significant response error which has manifested itself by a shift from Apartment (in 1976) to other types of dwellings in multiple unit structures, and, to a lesser degree, to Single Detached. It is reasonable to conclude that, for this area, the 1981 classification by Structural Type contains, as a minimum, the degree of error implied by the differences in the counts and that the adjusted 1981 counts more accurately reflect the Structural Type distribution for the area. At the same time it is also reasonable to conclude that classification problems were present in the 1976 Census as well. While the 1976 counts - based upon evaluation of 1976 and 1981 data - can be expected to be very much more accurate than the 1981 counts, in this case they may still contain non-negligible error. The largest proportion of such error will be among the multiple unit structures (Apartments plus Other Multiple in this example).

Table Titles

- SDE81B41 Labour force 15 years and over by class of worker (7), by sex (3) and by 1980 employment income groups (8), 1981
- SDE81B42 Population 15 years and over who worked in 1980 by 1980 employment income groups (14), by sex (3), 1981
- SDE81B43 Population 15 years and over who worked in 1980 by 1980 employment income groups (5), by marital status (4), by sex (3), 1981
- SDE81B44 Population 15 years and over who worked in 1980 by 1980 employment income groups (5), by age groups (6), by sex (3), 1981
- SDE81B45 Population 15 years and over by 1980 employment income groups (5), by labour force activity (5a), by weeks worked in 1980 and whether these weeks were mostly full-time (see work activity in 1980 (7)), by sex (3), 1981
- SDE81B46 Population 15 years and over by 1980 wage and salary income groups (8) by weeks worked in 1980 and whether these weeks were mostly full-time (see work activity in 1980 (5)), by sex (3), 1981
- SDE81B47 Paid workers in the labour force by 1980 wage and salary income groups (5), by weeks worked in 1980 and whether these weeks were mostly full-time (see work activity in 1980 (5)), by sex (3), 1981

Legends

AGE GROUPS (6)

1. Total
2. 15-24 years
3. 25-34 years
4. 35-54 years
5. 55-64 years
6. 65 years and over

CLASS OF WORKER (7)

1. Total labour force
 2. Class of worker - Not applicable (1)
 3. Total experienced labour force
 4. Paid workers (2)
 5. Paid workers (2) who worked 40-52 weeks mostly full-time in 1980
 6. Self-employed (3)
 7. Unpaid family workers
-

- (1) Unemployed persons 15 years of age and over, who had never worked or had worked only prior to January 1, 1980.
- (2) Includes self-employed in incorporated companies.
- (3) Includes self-employed in unincorporated companies only.

LABOUR FORCE ACTIVITY (5A)

1. Total
2. In the labour force
3. Employed
4. Unemployed
5. Not in the labour force

MARITAL STATUS (4)

1. Total
2. Single (never married)
3. Married and separated
4. Widowed and divorced

SEX (3)

1. Total
2. Male
3. Female

WORK ACTIVITY IN 1980 (5)

1. Total
2. Did not work in 1980
3. Worked in 1980
4. 40-52 weeks
5. Mostly full-time

WORK ACTIVITY IN 1980 (7)

1. Total
2. Did not work in 1980
3. Worked in 1980
4. 40-52 weeks
5. Mostly full-time
6. 49-52 weeks
7. Mostly full-time

1980 EMPLOYMENT INCOME GROUPS (5)

1. Total
2. Without employment income
3. With employment income
4. Under \$5,000 (1)
5. \$ 5,000 - \$ 9,999
6. 10,000 - 19,999
7. 20,000 and over
8. Average employment income (2)

(1) Includes loss.

(2) For persons with employment income.

1980 EMPLOYMENT INCOME GROUPS (14)

1. Total
 2. Without employment income
 3. With employment income
 4. Under \$2,000 (1)
 5. \$ 2,000 - \$ 4,999
 6. 5,000 - 7,999
 7. 8,000 - 9,999
 8. 10,000 - 11,999
 9. 12,000 - 14,999
 10. 15,000 - 19,999
 11. 20,000 - 24,999
 12. 25,000 and over
 13. 15,000 and over
 14. Average employment income (2)
-

(1) Includes loss.

(2) For persons with employment income.

1980 WAGE AND SALARY INCOME GROUPS (5)

1. Total
 2. Without wages and salaries
 3. With wages and salaries
 4. Aggregate wages and salaries \$'000
 5. Average wages and salaries (1)
-

(1) For persons with wages and salaries.

1980 WAGE AND SALARY INCOME GROUPS (8)

1. Total
 2. Without wages and salaries
 3. With wages and salaries
 4. Under \$5,000
 5. \$ 5,000 - \$ 9,999
 6. 10,000 - 19,999
 7. 20,000 and over
 8. Average wages and salaries (1)
-

(1) For persons with wages and salaries.

SECTION B

FILE SEQUENCE AND GEOGRAPHIC DEFINITIONS

1) Sequence of 1981 Census User Summary Tape Files - Census Subdivisions (Basic Series)

Census subdivision (CSD) files are sorted in the following ascending numeric sequence:

| <u>Keys</u> | <u>Position in record</u> | <u>Description</u> |
|----------------|-----------------------------------|--------------------------|
| Major | 51-52 | Record type |
| Intermediate 1 | 1-2 | Region and province code |
| Intermediate 2 | 3-4 | Census division code |
| Minor | 5-7 | Census subdivision code |

Geographic codes on each record

| Record type | Description | Number of records | Position | Content |
|-------------|--|-------------------|----------|---|
| 01 | Canada total record | 1 | 1-17 | Zeroes |
| | | | 18-49 | Geographic name - Canada |
| | | | 50 | Indian Reserve - High imputation area indicator |
| | | | 51-52 | Record type |
| 02 | Provincial total records in ascending numeric sequence | 12 | 1-2 | Region and province code |
| | | | 3-17 | Zeroes |
| | | | 18-49 | Province name |
| | | | 50 | Indian Reserve - High imputation area indicator |
| | | | 51-52 | Record type |
| 16 | Census division (CD) records in ascending numeric sequence within province | 266 | 1-2 | Region and province code |
| | | | 3-4 | CD code |
| | | | 5-17 | Zeroes |
| | | | 18-49 | Census division name |
| | | | 50 | Indian Reserve - High imputation area indicator |
| | | | 51-52 | Record type |

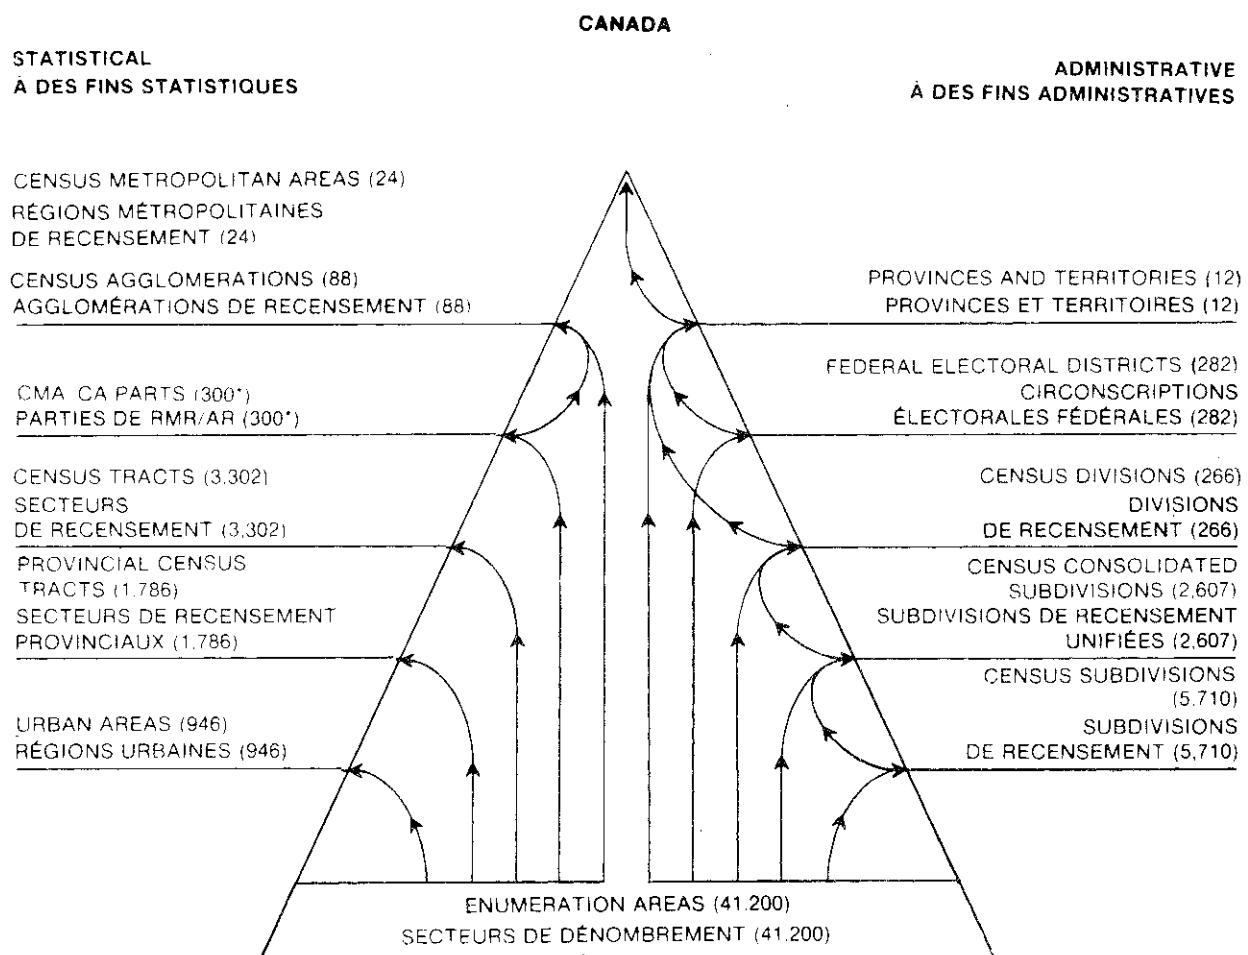

Geographic codes on each record

| Record type | Description | Number of records | Position | Content |
|--------------------|--|--------------------------|------------------------------------|---|
| 17 | Census subdivision (CSD) records in ascending numeric sequence within census division and province | 4,563 | 1-2 3-4 5-7 8-17 18-49 | Region and province code CD code CSD code See tape documentation CSD name |

Note: There are 4,842 records on the census subdivision summary tape files covering all of Canada.

Figure 1.

**The 1981 Census Geographic Hierarchy
Ordre hiérarchique des unités géographiques du recensement de 1981**

The numbers in brackets represent the number of each type of area.

Les chiffres entre parenthèses correspondent au nombre d'unités dans chaque catégorie.

* Approximate number

* Chiffres approximatifs

2) Geographic Definitions

Standard Geographical Classification (SGC)

The Standard Geographical Classification provides systematic identification for three types of geographic areas. These are:

- (1) provinces and territories;
- (2) census divisions (counties, regional municipalities, and regional districts, for example); and
- (3) census subdivisions (usually municipalities).

The three area systems are hierarchically related. Census subdivisions (CSDs) aggregate to census divisions (CDs), which in turn aggregate to a province or a territory (PR). This relationship is reflected in the seven-digit SGC code:

| | | |
|--------------------|----|--------------------------------|
| PR | CD | CSD |
| XX | XX | XXX (X denotes one digit) |
| Census Subdivision | | |
| Census Division | | |

Province or Territory

Remarks: For the 1981 Census, the Standard Geographical Classification is the sole official geographical classification system for dissemination purposes.

Due to a Statistics Canada policy of standardizing geographical codes wherever possible, census codes are no longer available. To uniquely identify any geostatistical area in Canada, it is necessary to employ the Standard Geographical Classification codes. For example, in 1976, a 4-digit census code uniquely identified census subdivisions within provinces. In 1981, it is necessary to use a 2-digit census division code plus a 3-digit census subdivision code to uniquely identify those census subdivisions.

Field: 1

Position: 1-2

Region and Province Code

This field presents the major political division of Canada. There are ten provinces and two territories coded as below. The first digit represents the geographic region of Canada to which the province belongs. Code notation is the Standard Geographical Classification (SGC) code and is assigned geographically from east to west. In census tabulations, provincial tables include the Yukon and Northwest Territories.

Code Assignment

| <u>Region</u> | <u>Province</u> | <u>Code</u> |
|------------------|-----------------|-------------|
| Canada | Total | 00 |
| Atlantic | Nfld. | 10 |
| | P.E.I. | 11 |
| | N.S. | 12 |
| | N.B. | 13 |
| Quebec | Que. | 24 |
| Ontario | Ont. | 35 |
| Prairies | Man. | 46 |
| | Sask. | 47 |
| | Alta. | 48 |
| British Columbia | B.C. | 59 |
| Territories | Yukon | 60 |
| | N.W.T. | 61 |

Field: 2

Position: 3-4

Census Division (CD)

This field presents census divisions, the general term applying to counties, regional districts, regional municipalities and five other types of geographic areas made up of groups of census subdivisions. In Newfoundland, Manitoba, Saskatchewan and Alberta, the term describes areas that have been created by Statistics Canada in cooperation with the provinces as an equivalent for counties.

Remarks: In the 1981 Census there are five census divisions in the Northwest Territories; this increase of one census division for the Northwest Territories results from the creation of the Central Arctic Region that, in 1976, was a part of the Fort Smith Region.

Major redelineation of census divisions occurred in Manitoba in 1976 and 1961 and in British Columbia in 1971.

The creation of Regional Municipalities in Ontario between 1969 and 1975 required the redefinition of some census divisions in Ontario.

See list of census division names and codes on the following pages.

Field: 3

Position: 5-7

Census Subdivision (CSD)

This field presents the Standard Geographical Classification code for each CSD.

Census subdivision refers to the general term applying to municipalities, Indian Reserves, Indian Settlements and unorganized territories.

In Newfoundland, Nova Scotia and British Columbia, the term also describes geostatistical areas that have been created by Statistics Canada in cooperation with the provinces as an equivalent for municipalities.

Remarks: The 1981 Census was taken according to the municipal boundaries in effect on January 1, 1981.

It should be noted that the parts of Flin Flon located in Manitoba and Saskatchewan and the parts of Lloydminster located in Saskatchewan and Alberta are treated as separate CSDs.

In 1981, for the first time, each Indian Reserve and unorganized territory is reported separately in those census tabulations reporting data by census subdivision.

Summaries of CSD changes are available in the form of two bulletins:

- (1) Changes to Municipal Boundaries, Status and Names (Catalogue No. 12-201, Annual); and
- (2) Standard Geographical Classification, 1981, Vol. I (Catalogue No. 12-567, Occasional).

For a detailed listing of census subdivisions, see Enumeration Area Reference Lists (Catalogue Nos. 99-909 to 99-912) or the Standard Geographical Classification, 1981, Vol. II (Catalogue No. 12-568, Occasional).

Field: 4

Position: 8

CSD Population Size Group

This field is a population size descriptor. It is used to classify all CSDs into predetermined population size groups, as follows:

| <u>Population</u> | <u>Size code</u> |
|-------------------|------------------|
| 0 - 999 | 8 |
| 1,000 - 2,499 | 7 |
| 2,500 - 4,999 | 6 |
| 5,000 - 9,999 | 5 |
| 10,000 - 29,999 | 4 |
| 30,000 - 99,999 | 3 |
| 100,000 - 499,999 | 2 |
| 500,000 and over | 1 |

Field: 5

Position: 9-10

Census Subdivision Type Code

This field classifies all census subdivisions according to the official designations adopted by the federal and provincial authorities.

Census subdivision names and types depend on the definition assigned by the provincial authorities; as a result, many of them may differ from region to region.

In the 1976 Census, codes were assigned in two groups. The first group contained 22 designations considered to have a local government and identifiable by the general term of municipality; among other things, this group included incorporated cities, towns and villages, boroughs, hamlets and all types of municipalities.

The second group included nine designations for territories governed by provincial or federal agencies, including Regional District Subdivisions, National Parks, Unorganized Territories, Indian Reserves and Settlements.

For the 1981 Census, this census subdivision type code structure has been modified. The distinction between entities with a local government and those governed by provincial or federal agencies is no longer a criterion in the assignment of codes. The 1976 codes used to denote a particular type were retained in the 1981 Census provided this type had not been affected by any major changes.

One major change in the 1981 Census is the unilingualism of census subdivision types by province of origin. Only those types federally created or found in all provinces are bilingual.

The following list shows the census subdivision types, the provinces or territories in which they are located, and the 1976 and 1981 codes. The changes are identified by footnotes.

LIST OF CENSUS SUBDIVISION TYPES

| 1976 Code | Designation | 1981 Code | Abbreviation | Location (province) |
|----------------------|--|----------------------|---------------------|--|

| 92 | Indian Settlement - Établissement indien | 92 | S-E(24) | QUE.,ONT.,MAN. |
| 93 | Non Reserve (25) | | | QUE.,ONT. |
| | Settlement (26) | 93 | SET | N.W.T. |

- (1) In the 1976 Census these were designated Town - Ville, in all provinces. In the 1981 Census the designation "Town" was used in all provinces except Quebec.
- (2) Summer Village no longer exists in Saskatchewan.
- (3) The designation "Ville" was added for the province of Quebec.
- (4),(5),(6),(7),(9) The designation "Municipalité" (generic term) used for 1976 was replaced by four types of municipalities: "Canton", "Cantons unis", "Paroisse" and "Sans désignation".
- (8) TP replaces TM as the abbreviation for Township.
- (10) Resort Village is new for 1981.
- (11) Municipal Corporation is new for 1981.
- (12) The designation "Rural District" was changed to Town in 1981.
- (13) Codes 33 and 34 were combined for the 1981 Census.
- (14) Local Improvement District is exclusive to the Yukon; the 1976 LIDs in Newfoundland became Town, those in Saskatchewan became Rural Municipality.
- (15) Local Government Community became Community.
- (16) The abbreviation SA is new for 1981.
- (17) CSD type code 53 no longer exists in 1981.
- (18) The designation National Park no longer exists in 1981; Prince Albert National Park (Saskatchewan) becomes Unorganized - Non organisé and the National Parks in Alberta become Improvement District.
- (19) Parish no longer exists in Quebec and Prince Edward Island for 1981.
- (20) The abbreviation LOT is new for 1981.
- (21) UNO becomes the new abbreviation for Unorganized Territory.
- (22) SUN becomes the new abbreviation for Unorganized Territory in Newfoundland.
- (23) R remains as the abbreviation for the designation Indian Reserve.
- (24) S-E becomes the new abbreviation for the designation Indian Settlement.
- (25) The designation Non Reserve no longer exists in 1981.
- (26) Code 93 is used for the new designation Settlement.

Field: 6

Position: 11-13

Census Consolidated Subdivision (CCS)

This field identifies a geostatistical area created by Statistics Canada.

A census consolidated subdivision is a geographically contiguous group of census subdivisions.

Two rules are applied in delineating census consolidated subdivisions:

- (1) all census subdivisions smaller than 25 square kilometres are grouped with a larger subdivision; and
- (2) if a census subdivision greater than 25 square kilometres is surrounded on more than half its perimeter by another subdivision, it is included as part of the CCS formed by the other subdivision; if not, the census subdivision forms a CCS on its own.

Those wishing to use this field should consult the Enumeration Area Reference Lists (Catalogue Nos. 99-909 to 99-912).

Field: 7

Position: 14-16

Census Metropolitan Area/Census Agglomeration (CMA/CA)

This field presents geostatistical areas created by Statistics Canada.

Census Metropolitan Area (CMA)

Refers to the main labour market area of an urbanized core (or continuously built-up area) having 100,000 or more population. CMAs are created by Statistics Canada and are usually known by the name of the urban area forming their urbanized core. They contain whole municipalities (or census subdivisions). CMAs are comprised of (1) municipalities completely or partly inside the urbanized core; and (2) other municipalities if (a) at least 40% of the employed labour force living in the municipality works in the urbanized core, or (b) at least 25% of the employed labour force working in the municipality lives in the urbanized core.

Since a CMA must contain whole census subdivisions, its limits may fall within, or extend beyond, the actual labour market area. The differences may be significant in those parts of Canada where census subdivisions cover particularly large areas of land. Census metropolitan areas may also differ from Metropolitan Areas designated by local authorities for planning or other purposes.

Remarks: CMAs remain unchanged from 1976 except for minor adjustments to respect new municipal limits. Trois-Rivières, Quebec, becomes Canada's 24th CMA as a result of recent growth in its urbanized core.

Census Agglomeration (CA)

Refers to the main labour market area of an urbanized core (or continuously built-up area) having between 10,000 and 99,999 population. CAs are created by Statistics Canada and are usually known by the name of the urban area forming their urbanized core. They contain whole municipalities (or census subdivisions). CAs are comprised of (1) municipalities completely or partly inside the urbanized core; and (2) other municipalities if (a) at least 40% of the employed labour force living in the municipality works in the urbanized core, or (b) at least 25% of the employed labour force working in the municipality lives in the urbanized core.

Since a CA must contain whole census subdivisions, its limits may fall within, or extend beyond, the actual labour market area. The differences may be significant in those parts of Canada where census subdivisions cover particularly large areas of land.

Remarks: Census agglomerations are now delineated according to the same criteria as census metropolitan areas (CMAs) and differ only in the size of their urbanized cores (CMAs having 100,000 or more population). Twenty-four CAs have been added to the programme as a result of this change. At the same time, 23 CAs have been deleted from the programme as a result of raising the minimum urbanized core population from 2,000 to 10,000. One CA, Trois-Rivières, Quebec, has been transferred to the CMA programme as a result of recent growth in its urbanized core. The net effect of the above changes has been to maintain the total number of CAs at 88.

Note: If positions are zeros, the EA is not part of a CMA or a CA.

See list of census metropolitan areas and census agglomerations on the following pages.

CMA/CA Selector

This field identifies a given EA as belonging to a CMA or a CA as follows:

| <u>Code</u> | <u>Description</u> |
|-------------|--------------------|
| 1 | CMA |
| 2 | CA |
| 0 | not a CMA/CA |

Field: 9

Position: 18-49

This field contains the name of the geographic area.

Field: 10

Position: 50

**Indian Reserve - High Imputation
Area Indicator**

Indian Reserves KAHNAWAKE 14, WEBIQUI, WUNNUMIN 2, KINGFISHER 1, PEIGAN 147,
COWICHAN 1, THEIK 2, COWICHAN 9

For the geographic areas above, a significant portion of the data has been imputed. Consequently, these areas have been suppressed. However, the data have been included in all higher geographic subtotals and totals. For an assessment of the impact on data quality for these areas, the user is advised to refer to Data Quality - Total Population (Catalogue No. 99-904) and Data Quality - Sample Population (Catalogue No. 99-905).

In this field:

1 = Includes Indian Reserve(s) or part(s) of Indian Reserve(s) identified as high imputation area(s).

Blank = Does not include Indian Reserves or parts of Indian Reserves identified as high imputation areas.

The table on the following page indicates all the geographic areas in question.

SECTION C

GEOGRAPHIC ORGANIZATION

The organization of the User Summary Tape files and microfiche for the 1981 Census is as follows:

Census Subdivision (CSD) Series

- Tables include data for census subdivisions, census divisions (CDs), provinces and Canada.
- The beginning of the User Summary Tapes and microfiche include all total records, i.e. Canada, provinces and census divisions.

Information will be in the following order:

| <u>Geography</u> | <u>User Summary Tapes</u> |
|---------------------|--|
| Canada | |
| Provinces | Numeric sequence (east to west) |
| Census divisions | Numeric sequence within province |
| Census subdivisions | Numeric sequence within census division and province |

| <u>Geography</u> | <u>Microfiche</u> |
|---------------------|-------------------------------------|
| Canada | |
| Provinces | Numeric sequence (east to west) |
| Census divisions | Alphabetic sequence within province |
| Census subdivisions | Alphabetic sequence within province |

Each CSD level tape record will contain the following geographic identification:

Region and province code

Census division (CD) - Standard Geographical Classification (SGC)

SECTION D

SUPPLEMENTARY INFORMATION

CONFIDENTIALITY AND RANDOM ROUNDING

The Statistics Act states that no employee of Statistics Canada "... shall disclose or knowingly cause to be disclosed, by any means, any information obtained under this Act in such a manner that it is possible from any such disclosure to relate the particulars obtained from any individual return to any identifiable individual person, business or organization." (section 16 (1) (b), Statistics Act, 1970-71). The continuing development of new data storage systems and of flexible, generalized retrieval software, and the size of the 1981 Census tabulation and publication program make it difficult to use manual methods to ensure compliance with the Statistics Act. Thus, a technique known as "random rounding" is applied at the final stage of tabulations for all 1981 Census tabulations (including User Summary Tapes/Fiche). Under this method, all figures including totals are randomly rounded (either up or down) to a multiple of "5".

Although the tables subjected to random rounding appear similar to tables whose entries have been conventionally rounded, the process is different. In random rounding, the decision as to whether the last digit in a number will be rounded up or down (to a 0 or a 5) is determined by chance rather than by rules based on the value of the number. This aspect of the process generally introduces sufficient uncertainty into the last digit of the number to provide strong protection against direct, residual or negative disclosures without adding significant error to the census data. However, since totals are independently rounded they do not necessarily equal the sum of individual rounded figures in distributions. Minor differences can be expected for corresponding totals and cell values in various reports. Also, percentages, which are calculated on rounded figures, do not necessarily add to the total. Similarly, any total or cell value of a table which is an aggregation of other tables may differ from the sum of the corresponding rounded values contained in the component tables as these are all rounded independently.

Of concern to some users is that small cell counts may suffer a significant distortion as a result of random rounding and that this will be magnified when these same data cells are aggregated. This distortion is the protection against disclosure and individual data cells containing these small numbers may lose their precision as a result. Since the rounding is of a random nature, however, when data cells are re-aggregated by the user the rounding errors tend to cancel out. Thus aggregations can be used with confidence.

In addition to random rounding, for certain very small areas, to avoid publishing meaningless and potentially misleading data, and to absolutely avoid disclosure, a procedure referred to as "area suppression" has been adopted. Basically, the geographic area itself, as well as all data, is dropped completely from the tabulation in cases where there are fewer than 50 persons for self-enumeration areas and fewer than 25 persons for canvasser areas. Suppressed data are, however, included in the appropriate higher aggregate subtotals and totals. "Area suppression" is applied only to the sample data file, affecting the Profile Series B of bulletins and all of the User Summary Tape/Fiche program. In the case of income distributions, data are deleted if the total non-inmate population concerned is less than 250. This applies only to the User Summary Tape/Fiche program, at the census tract and census subdivision levels, and within the Profile Series B.

The actual census tract (CT) or census subdivision (CSD) suppressed due to the rule described is indicated in the appendix to each Series B bulletin affected. Basic population counts, land area (and other data collected on a 100% basis) for these "missing" or suppressed entities can be obtained from the corresponding Profile Series A of bulletins, or tape and fiche program. (See Products and Services of the 1981 Census of Canada.)

Further, for certain subject-matter areas in the national and provincial bulletin series - income and industry/occupation - users will note the suppression of distributions where less than 250 persons or units are involved. In this case, the total area concerned is not suppressed, and as in "area suppression", such suppressed information is included in higher aggregates.

Further slight variations may exist in certain other circumstances, and more complete details on suppression will be contained in the Summary Guide - Sample Population (Catalogue No. 99-903).

Counts of the Number of Geographic Records - 2A Tables (no suppression) versus 2B Tables (with suppression) for the User Summary Tape/Microfiche Series, 1981 Census

SAMPLING AND WEIGHTING

The 1981 Census data were collected either on a 100% basis (i.e. from all households), or on a sample basis (i.e. from only a random sample of households) with data weighted to provide estimates of the entire population. The information contained in this User Summary Tape/Fiche package was collected on a 20% sample basis and then weighted up to compensate for sampling.

The weighting system used in the 1981 Census (as in the 1971 and 1976 Censuses) is the raking ratio estimation procedure. This is an iterative procedure designed to ensure that sample estimates for certain basic subgroups of the population agree with the corresponding population totals. This is intended to not only improve the consistency between 100% and sample data tabulations but to improve the reliability of estimates from the sample.

This procedure will ensure consistency between sample estimates and population values for the chosen subgroups and for combinations of these subgroups. However, although the procedure will tend to improve consistency for smaller subgroups it will not ensure consistency for these smaller groups, nor for groups with characteristics not used as controls. For any given geographic area, the weighted population total or subtotal may differ from that shown in reports containing data collected on a 100% basis.

With some minor exceptions, the population or universe (persons, households, dwellings or families) totals for Canada, the provinces and territories and census divisions, for sample and 100% data will coincide since such counts were used as controls in the weighting procedure.

DATA QUALITY

Introduction

Any census data will be subject to error. Some of the errors will tend to cancel out over a large number of cases (i.e. for larger cells) as errors will be made in both directions (i.e. random errors). In general the proportion or rate of net (i.e. uncancelled) random error increases as the population or cell size decreases. Thus small data values should be used with some caution.

Other of the errors will tend not to cancel out as they will have a tendency to occur in one direction more than another (systematic errors, for example, question wording which invites errors in one direction more than in the other) and will result in a bias.

The data contained in this file are subject to coverage errors, response errors, processing errors and to sampling errors, in addition to any errors introduced by random rounding.

Coverage Error

A coverage error occurs in the census whenever a person or a household is missed completely or counted more than once. Since overcoverage is expected to be fairly rare in relation to undercoverage, the net effect of such errors is to introduce a downward bias in census figures, so that the published census estimates tend to underestimate the actual population.

A special study was undertaken in relation to the 1981 Census to measure the extent of the bias due to undercoverage. This study estimated the overall undercoverage rate to be of the order of 2% of the total population. It also indicated that undercoverage is higher in certain segments of the population, e.g., young male adults and recent immigrants. Similar trends were obtained in connection with the 1976 Census.

Response Error

A response error occurs when the response recorded is incorrect. Such errors may occur due to the respondent misinterpreting the question, inadvertently checking the wrong box, or even consciously checking the wrong box. Contributing to this error may be the questionnaire wording or organization, or the training and attitude of enumerators.

One indicator of the quality of the data is the "response rate". A response rate in this case is defined as the number of times the value for the characteristic was obtained from the respondent divided by the number of times it should have been obtained. This measure gives an indication of response quality, and in turn, of the extent of imputation required for non-response.

Table 1 below presents the response rates obtained in the 1981 Census for the stated characteristics.

Table 1: Response Rates for Selected Characteristics in the 1981 Census

| Characteristic | Response rate (%) |
|--|----------------------|
| Age | 98.9 |
| Age at First Marriage | 91.9 |
| Bathrooms | 99.0 |
| Children Ever Born | 95.8 |
| Class of Worker | 95.4 |
| Condition of Dwelling | 98.3 |
| Full-time/Part-time Weeks Worked | 92.4 |
| Highest Degree, Certificate or Diploma | 98.1 |
| Highest Grade of Elementary or Secondary | 92.9 |
| Hours Worked in Reference Week | 97.5 |
| Household Maintainer | 98.5 |
| Incorporation Status | 91.2 |
| Industry | 96.6 |
| Labour Force Activity | 94.1 |
| Length of Occupancy | 99.3 |
| Main Type of Heating Equipment | 97.3 |
| Marital Status | 98.7 |
| Mobility Status | 96.2 |
| Mother Tongue | 98.9 |
| Number of Rooms | 98.9 |
| Occupation | 95.8 |
| Period of Construction | 97.6 |
| Principal Heating Fuel | 97.0 |
| Principal Water Heating Fuel | 97.1 |
| Province, CD, CSD of Residence in 1976 | 95.2 |
| Relationship to Person 1 | 99.2 |
| School Attendance | 98.2 |
| Sex | 99.2 |
| Structural Type | 99.6 |
| Tenure | 99.1 |
| Tenure - Condominium | 96.2 |
| Weeks Worked | 94.7 |
| When Last Worked | 96.5 |
| Years of Other Non-University Education | 95.9 |
| Years of University | 97.0 |

Processing Error

Processing errors can occur when write-in answers are coded, when responses on the questionnaire are transcribed to be read by the computer, and when imputations are done either for non-response or for edit rejects.

Sampling Error

Data based upon responses collected on a sample basis and then weighted are subject to error due to the fact that the distribution of characteristics within the sample will not usually be identical to the distribution of characteristics within the population from which the sample has been selected.

The potential error that sampling has introduced will vary according to the relative scarcity of the characteristics in the population. For large cell values the potential error due to sampling, as a proportion of the cell value, will be relatively small. For small cell values this potential error, as a proportion of the cell value, will be relatively large.

Table 2 provides approximate measures of the error due to sampling. These measures are intended as a general guide only.

**Table 2: Approximate Standard Error Due to Sampling
for 1981 Census Sample Data**

| Cell value | Total number of persons, households, dwellings or families in geographic area | | | | | | | | | | 5,000,000 or over |
|------------|---|-------|-------|--------|--------|--------|---------|---------|-----------|-------|----------------------|
| | 500 | 1,000 | 5,000 | 10,000 | 20,000 | 50,000 | 100,000 | 250,000 | 1,000,000 | | |
| 50 | 15 | 15 | 15 | 15 | 15 | 15 | 15 | 15 | 15 | 15 | 15 |
| 100 | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 |
| 200 | 25 | 25 | 30 | 30 | 30 | 30 | 30 | 30 | 30 | 30 | 30 |
| 500 | - | 30 | 40 | 45 | 45 | 45 | 45 | 45 | 45 | 45 | 45 |
| 1,000 | - | - | 60 | 60 | 60 | 65 | 65 | 65 | 65 | 65 | 65 |
| 2,000 | - | - | 70 | 80 | 85 | 90 | 90 | 90 | 90 | 90 | 90 |
| 5,000 | - | - | - | 100 | 120 | 135 | 140 | 140 | 140 | 140 | 140 |
| 10,000 | - | - | - | - | 140 | 180 | 190 | 195 | 200 | 200 | 200 |
| 20,000 | - | - | - | - | - | 220 | 255 | 270 | 280 | 280 | 280 |
| 50,000 | - | - | - | - | - | - | 315 | 400 | 435 | 445 | |
| 100,000 | - | - | - | - | - | - | - | 490 | 600 | 625 | |
| 500,000 | - | - | - | - | - | - | - | - | 1,000 | 1,340 | |
| or over | | | | | | | | | | | |

Users wishing to determine the approximate error due to sampling for any given cell of data based upon the 20% sample should follow the following procedures:

- (a) A tabulation within this file will typically apply to a universe of persons, households, dwellings or families. It is first necessary to establish the total count for the particular geographic level - census tract, census subdivision, census division, province, etc. - to which the cell under consideration applies.

99-915 Provincial Census Tracts - Quebec

99-916 Provincial Census Tracts - Ontario

99-917 Provincial Census Tracts - Western Provinces and the Territories

99-918 Census Metropolitan Areas and Census Agglomerations, Components

Changes to Municipal Boundaries, Status and Names (Catalogue No. 12-201, Annual)

Standard Geographical Classification, 1981, Vol. I (Catalogue No. 12-567, Occasional)

Standard Geographical Classification, 1981, Vol. II (Catalogue No. 12-568, Occasional).

REFERENCE PRODUCTS

The 1981 Census Dictionary (Catalogue No. 99-901) contains the complete range of definitions for all variables and terms used in the 1981 Census data products. Of general interest would be information contained in Summary Guide - Total Population (Catalogue No. 99-902) and Summary Guide - Sample Population (Catalogue No. 99-903) which include lists and indexes of tables appearing in the data publications, as well as reproductions of the census questionnaire forms and basic indicators of data quality. Further details on the data quality may be obtained from Data Quality - Total Population (Catalogue No. 99-904) and Data Quality - Sample Population (Catalogue No. 99-905).

A wide range of other analytical and reference products are available and described, along with information on data products and available services, in Products and Services of the 1981 Census of Canada.

- (b) Choose the column in Table 2 whose heading is closest in value to the universe total count for the geographic area.
- (c) Choose the row within the column in Table 2 whose heading is closest to the value of the given cell in the census tabulation. The value within the column in this row will be the approximate standard error due to sampling for the cell under consideration.

The effect of the particular sample design and weighting procedure used in the 1981 Census will vary, however, from one characteristic to another. The standard error values in the above table may, therefore, underestimate or overstate the error due to sampling. The sample selected in the census is one of households rather than one of persons. In assessing the potential error due to sampling, for characteristics of persons, it is necessary to consider whether or not the response of all persons within the household will be similar. If they are not (uncorrelated), then the sampling error will tend to be lower. If they are (correlated) - e.g. migration - then the sampling error will tend to be higher.

For households, families, dwellings and uncorrelated person characteristics, when using these standard error values, the user can be reasonably certain that, for the enumerated population, the true value (discounting all forms of error other than sampling) lies within plus or minus twice the standard error (e.g., for a cell value of 1,000 for a geographic area with a population of 50,000 the range would be $1,000 + or - 2 \times 65$ or $1,000 + or - 130$). For correlated person characteristics, the user can be reasonably certain that, similarly, the true value lies within plus or minus three times the standard error (e.g., for a cell value of 5,000 for a geographic area with a population of 100,000 the range would be $5,000 + or - 3 \times 140$ or $5,000 + or - 420$).

Factors which can be applied as an adjustment to these standard error values for each individual variable may be obtained by contacting the nearest Statistics Canada reference centre.

These adjustment factors, additional information on the census methodology - in particular on sampling and weighting - and a more comprehensive assessment of the quality of the census data collected on a sample basis will be included in Data Quality - Sample Population (Catalogue No. 99-905).

SECTION E

SPECIAL NOTES

Census Family Type Data

In previous censuses, the primary family was defined as the family of the head of the household. In 1981, the criterion for determining family type was changed. A new question was added to the census questionnaire to determine a person responsible for paying the rent, or mortgage, or taxes, or electricity, and is used to identify primary and secondary families.

Due to improvements in the method of determining Census Family Type implemented for the 1981 Census, caution should be used in comparing the distribution of primary and secondary families with data from previous censuses. For example, census families in private households where the person responsible for household payments is residing elsewhere are automatically classified as secondary families in 1981. In previous censuses, first, the identification of these cases was not possible and second, some of these families were classified as primary families.

Further explanation of these changes is included in the Summary Guide - Total Population (Catalogue No. 99-902).

Census Metropolitan Areas and Census Agglomerations Crossing Provincial Boundaries

Due to the method of production used for User Summary Tapes and microfiche, it was not feasible to produce a census metropolitan area or a census agglomeration total for areas crossing provincial boundaries. Consequently, for the census metropolitan area of Ottawa-Hull it is necessary to add together data for Ottawa-Hull from both the Ontario and Quebec parts in order to obtain a total. Additions are also required in order to obtain the totals for the census agglomerations of Cornwall and Hawkesbury (Ontario and Quebec parts) and Flin Flon (Manitoba and Saskatchewan parts). Totals are shown for census metropolitan areas and census agglomerations crossing provincial boundaries in the Profile Series as a different method of production was used.

Class of Worker - Not applicable - Table SDE81B41

The category "Class of Worker - Not applicable" includes persons who did not work in 1980 or 1981. Most of those persons would have received no employment income in 1980. However, some persons may have been paid in 1980 for work performed in 1979.

Ethnic Origin

The 1981 ethnic origin question attempts to trace the "roots" of the population of Canada. The data derived from this question reflect respondents' perception of their ethnic background, and the cultural group with which they most closely identify.

The comparability of the 1981 ethnic origin data with that from previous censuses is affected by seven main factors:

- (1) Previous censuses usually traced ethnic origin (racial origin) through the paternal ancestry.⁽¹⁾ The 1981 Census is the first that does not restrict the tracing of ethnic origin to one side of the family.
- (1) In censuses from 1911 to 1931, the line of descent of people with Native or mixed Native/Non-native ancestry was traced through the mother's side.

- (2) The 1981 Census is the first to allow more than one ethnic origin response per individual (e.g., a response of French and German is valid and is retained for tabulation purposes). Previous censuses reduced all multiple ethnic origin responses down to a single response. For the 1971 Census, if more than one origin was indicated on the questionnaire, one was arbitrarily selected. Thus, in 1971, if 100 people answered both French and German, perhaps 45 would have been assigned French, and the remaining 55, German. In 1981, all 100 people would retain both ethnic origins.
- (3) In 1981, 7.6% of the non-inmate population indicated more than one ethnic origin. It should be noted however, that this percentage excludes combinations of English, Irish, Scottish, Welsh, British, n.o.s., and British, n.e.s. These combinations have been treated as a single response (i.e. British) in the 1981 pre-planned output although they are, in fact, multiples. If counted as multiples, the percentage of the non-inmate population with multiple ethnic origins would be 11.6% in 1981.

On the other hand, French single responses only include those who reported a single French ethnic origin or a single write-in of Québécois, Franco-Ontarian or Acadian. Those who reported both French and Québécois, Franco-Ontarian or Acadian are included in the French multiples.

- (4) As 1971 Census processing reduced all multiple responses to a single response, it is not possible to compare 1971 data to 1981 for single responses. This comparison could underestimate the real change. This applies particularly to some European ethnic origins; for example, English, Scottish, Irish, Dutch, Ukrainian, Polish and Jewish registered a negative percentage change.

Similarly, a comparison of 1971 data to single plus multiple responses in 1981 could overestimate the real change.

However, certain ethnic groups which have immigrated to Canada in substantial numbers show a large increase from 1971 even when compared to the 1981 single origin; these are groups such as Chinese, Indo-Pakistani, East Asian, Lebanese, Syrian and other Asiatic groups and Spanish (including South and Latin-American).

- (5) In 1971, everyone who indicated their religion as Jewish was assigned a Jewish ethnic origin regardless of the origin reported. In 1981, although no such assignment occurs, 94% of the non-inmate population with a single Jewish ethnic origin response also reported their religion as Jewish.
- (6) It should also be noted that there may be some apparent anomalies in 1981 data based on a misinterpretation of the ethnic origin question when cross-classified with Place of Birth, Mother Tongue or Religion: by Place of Birth, some tables may include some Native Peoples born in India, Pakistan, Guyana, etc.; by Mother Tongue, some tables may include Native Peoples with Asian Indian mother tongue; and by religion some tables may include some Native Peoples with Eastern Non-christian religions, notably Hindu, Islam and Sikh.
- (7) In 1981, ethnic origin is reported for the total population excluding inmates. Counts from publications of previous censuses include inmates. Inmates represented about 1.1% of the total population in 1981.

Users should refer to the 1981 Census Dictionary for a basic description of the differences between 1971 and 1981. Further details on comparability will be contained in the regular bulletins and User Summary Tape products, as well as Summary Guides and Data Quality reports to be issued during the forthcoming year.

A5 Problem: Incorrect census subdivision formation

- (a) Fond du Lac 229, R, Sask. (SGC 4718824)
should be deleted
- (b) Fond du Lac 227, R, Sask. (SGC code not yet assigned) - should be created
- 1976 total population should read 452
- 1981 total population should read 494

A6 Problem: Incorrect census consolidated subdivision codes

- (a) Alert Bay 1, R, B.C. (SGC 5943801)
- CCS code reads 5943029
should read 5943035
- (b) Alert Bay 1A, R, B.C. (SGC 5943802)
- CCS code reads 5943029
should read 5943035

A7 Problem: Incorrect census subdivision limits

- (a) Jacquet River, VL, N.B. (SGC 1314002)
- 1981 total population reads 778
should read 887
- (b) Durham, PAR, N.B. (SGC 1314001)
- 1981 total population reads 2,656
should read 2,547

A8 Problem: Incorrect census subdivision limits

- (a) Norway House 17, R, Man. (SGC 4622058)
- 1981 total population reads 1,812
should read 1,976
- (b) Division No. 22, Unorganized, UNO, Man.
(SGC 4622046)
- 1981 total population reads 2,703
should read 2,539

A9 Problem: Incorrect census subdivision limits

- (a) Regina, C, Sask. (SGC 4706027)
- 1981 total population reads 162,613
should read 162,984
- (b) Sherwood No. 159, RM, Sask.
(SGC 4706026)
- 1981 total population reads 1,700
should read 1,329

A10 Problem: Incorrect census subdivision formation

- (a) Kitimat 1, R, B.C. (SGC 5949803)
should be deleted

A11 Problem: Incorrect enumeration area allocation

Home Language

Edit and imputation specifications for Mother Tongue and Home Language reduce multiple responses to a single response. In 1981, multiple resolution involved a series of choices based on the frequency of languages reported within the family, whereas the 1971 resolution of multiples was essentially a more arbitrary and deterministic procedure.

When compared to Mother Tongue data, the Home Language data may provide an indication of the extent to which persons still use or no longer use the language they reported as Mother Tongue.

However, depending upon the action of the editing process, cases of identically reported multiple mother tongues and home languages, may result in a certain proportion where Mother Tongue differs from Home Language.

For example, if a respondent indicated a Mother Tongue of English or French, the edited Mother Tongue would be either response, but not both. Similarly, depending on the edit result, the respondent's Home Language may be designated as English or French.

In 1981, the edit and imputation procedure has indicated that there were some 22% of respondents identified with English Mother Tongue and French Home Language who reported an English and French Home Language. Similarly, 11% of the respondents shown with French Mother Tongue and English Home Language reported also a French Home Language. Similar occurrences characterized 1971, but exact proportions are not known.

Users should refer to the 1981 Census Dictionary for a basic description of the differences between 1971 and 1981.

Income

Users are advised to consult the 1981 Census Dictionary, Catalogue No. 99-901, for a broad definition and derivation of total, average and median incomes, standard error of average income, major source of income and incidence of low income (income status). It should be noted that in the case of total income, employment income and wages and salaries, for the population (individuals 15 years and over), averages, medians and standard errors are calculated for individuals with income only. For all other universes, these statistics refer to all units, whether or not they reported any income. Aggregate income is the product of rounded count and unrounded average. The product is then rounded to the nearest thousand. However, the percentage distributions of aggregate income have been calculated prior to the rounding to thousands.

For the purposes of low income statistics, economic families and unattached individuals resident in the Yukon and Northwest Territories and on Indian Reserves are excluded from the estimates.

For a more comprehensive definition of (a) the components of total income and exclusions from the income concept, (b) the calculation of average income and median income and the interpretation of the standard error of average income, (c) the major source of income for the various universes, and (d) concept, coverage and derivation of low income statistics, see the relevant text in the following publications:

Catalogue No. 92-928 - Population, Total Income

Catalogue No. 92-934 - Private Households, Income

Catalogue No. 92-936 - Census Families in Private Households, Income

Catalogue No. 92-937 - Economic Families in Private Households, Income and Selected Characteristics

For information on the sources of income and their historical comparability, see Catalogue No. 99-903, Summary Guide - Sample Population.

For information on the quality aspects of income data, the user is referred to Catalogue No. 99-905, Data Quality - Sample Population.

Census income statistics are subject to sampling variability. Although such sampling variability may be quite small for large population groups, its effects cannot be ignored in the case of very small subgroups of population in an area or in a particular category. This is because, all other things being equal, the larger the sample size, the smaller is the error. For this reason income data on areas, other than enumeration areas, where the population was below 250, have been suppressed. The suppression criterion for enumeration areas is reduced to 25 or 50 persons. Where statistics are not suppressed but are still based on relatively small totals, the users are strongly advised to exercise caution in the use and interpretation of these statistics.

Inmates

Users should note that while some of the foregoing definitions of variables for which data were collected on a sample basis may specifically indicate the exclusion of "inmates", in actual fact, due to processing requirements, this is true of all population based tables in this report, even those involving cross-classification with data collected on a 100% basis (such as mother tongue). Moreover, the total population base for sample data, which can be referred to as the non-inmate population, will not exactly agree with the corresponding 100% figure, again due to a special processing requirement which lowered the final sample count by some 5,700 persons. Further details on this and any other processing changes affecting data comparability should be contained in Summary Guide - Sample Population (Catalogue No. 99-903) and Data Quality - Sample Population (Catalogue No. 99-905).

Labour Force Activity

In tables which apply to only a small proportion of the population or where extensive cross-classifications are present, the cell counts for some geographic areas are quite small. In these instances participation rates and unemployment rates may be unreliable. Users are strongly advised to exercise caution in the use and interpretation of these statistics.

Mobility Status

The geographic areas reflect boundaries as of January 1, 1981, the geographic reference date for the 1981 Census of Canada. Even when the geography refers to a 1976 place of residence (as in the case for out-migrants), it reflects the current (1981) boundary.

Not all migrants completed the question on their place of residence five years ago. In previous censuses, there were two levels of non-response: (i) those who failed to report any information (non-response); and (ii) those who gave enough information to establish their province of residence five years ago but not a location at the subprovincial level (partial response). In 1981, because of better geographic controls during processing, complete responses were imputed for these persons eliminating the need for a "not stated" category at the provincial and subprovincial area for place of residence five years ago.

The counts for total "Migrants" (a migrant is anyone who 5 years earlier did not have his/her usual place of residence within the CSD where he/she was enumerated) are additive across any geographic level - e.g., the migrant count at the Canada level is the sum of the migrants at the provincial level, etc. Additivity however does not hold across geographic levels in the case of in-migration or out-migration counts. For example, in-migrants at the census subdivision level include all migrants "from same province" and "from different province" whereas in-migrants at the provincial level would exclude those who come "from same province". Consequently, at the provincial level the subgroup "from same province" for in-migrants is not applicable as indicated in the table.

Mother Tongue

Comparability of the 1981 and 1976 Census mother tongue data is affected by a number of factors:

- (a) There has been a decrease in the non-response rate from 1.9% in 1976 to 1.1% in 1981. As a result, an unknown portion of the change in any given mother tongue is due to a better enumeration of the population.
- (b) In the 1976 Census the 1.9% of the population who did not respond to the mother tongue question had their language coded as Not Stated. In the 1981 Census the 1.1% of the population who did not respond to the question were assigned a specific language (see table below).

- (c) Procedures for the removal of multiple responses, provided by 2.4% of the 1981 population, have changed for the 1981 Census. In 1976, an arbitrary and deterministic processing edit blanked the multiple responses, leaving only one valid response for each individual. In the 1981 Census, multiple languages were assigned a single response using probabilistic computer algorithms (see table below for the redistribution of combinations of English, French and Other).
- (d) The category "Indian, n.o.s." includes persons who are of aboriginal ancestry and those of Asian Indian ancestry. In 1976, these persons were all coded to "Native Indian" as mother tongue.

Mother Tongue Information as Reported by Assigned Mother Tongue, Canada, 1981

1981 mother tongue assigned as

Mother tongue as reported in 1981

| | English | French | Other |
|--|------------|-----------|-----------|
| English only | 14,518,400 | ... | ... |
| French only | ... | 6,077,695 | ... |
| Other only ^{1,2} | ... | 2,495 | 2,897,730 |
| English and French ³ | 103,595 | 104,650 | ... |
| English and other ^{2,4} | 122,655 | 235 | 202,640 |
| French and other ⁵ | ... | 9,305 | 12,945 |
| English, French and other ³ | 7,845 | 7,375 | 14,250 |
| Non-response | 165,970 | 47,340 | 48,060 |
| Total | 14,918,460 | 6,249,095 | 3,175,625 |

Totals may not equal the sum of components due to rounding.

1 "Other" includes all non-official languages.

2 A number of write-in languages were potentially changed to French by computer edit (e.g., "Belgian" could be either "French" or "Flemish").

3 In 1976, a random choice was made between "English and French".

4 In 1976, all records with "English and other" were assigned to "English".

5 In 1976, all records with "French and other" were assigned to "French".

Users of these data should be aware that there is some impact on the comparability of the 1981 with 1976 Census data due to changes in processing procedures. However, problem-free information was provided by 96.5% of the population. Furthermore, for 98.0% of the population, the same data would have been published for 1981, whether the 1976 or the 1981 processing methodology had been used. For a more detailed explanation, users are referred to Data Quality -Total Population (Catalogue No. 99-904).

Number of Weeks Worked

The data on the number of weeks worked for the categories 40 to 48 weeks and 49 to 52 weeks should be used with caution. It appears that some respondents had a tendency to not include their weeks of paid leave for vacation or for other reasons in their total number of weeks worked, although instructed to do so. The 49 to 52 weeks category may therefore be underestimated.

Occupation

The data on Unit Groups 2791 ("Community College and Vocational School Teachers") and 2793 ("Post-secondary School Teachers, n.e.c.") for Quebec must be combined to permit comparisons with the corresponding groups for other provinces or with 1971 data because the Standard Occupational Classification misclassifies CEGEP professors in Unit Group 2793 when they should be included in 2791.

Official Language

The comparability of 1981 Census Official Language data with those from the 1971 Census is affected by the fact that different processing procedures were applied.

Users should be aware that in 1971, persons who declared an official language as either their home language or their mother tongue were also considered as being able to speak that language, and the response to official language was made to agree. In 1981, this editing convention was maintained only for those who reported an official language as home language.

A major impact of the 1981 processing change, compared to 1971, would appear to be fewer "bilingual" persons and higher numbers of people reporting "neither English nor French".

For example, in Manitoba and Saskatchewan, when 1981 data are compared to 1971 data, figures show a decline in the number of "bilingual" persons. However, when simulations of 1971 processing are applied to 1981 data, both provinces show an increase in the number of persons able to speak both English and French.

Users should refer to the 1981 Census Dictionary for a basic description of the differences between 1971 and 1981.

Population Born Outside Canada and Immigrant Population

All persons born outside Canada are not necessarily immigrants to Canada. Individuals who have reported their place of birth outside Canada, but who are Canadian citizens by birth, are not considered immigrants to Canada. Consequently, they do not have a period of immigration or an age at immigration when they take up permanent residence in Canada. For the 1981 Census product, these persons were categorized as non-immigrants; they did not have to be granted landed immigrant status before taking up permanent residence in Canada. By contrast, in the 1971 Census, all persons born outside Canada were categorized as immigrants and were required to respond to the question on period of immigration.

The refinement introduced in 1981, to incorporate citizenship at birth and to distinguish between Canadians by birth who had a place of birth outside Canada and persons who immigrate to Canada, thus affects the comparability of data from the two censuses. Footnotes to all tables providing statistics on the population born outside Canada indicate how the non-immigrant group has been treated.

While the regular census outputs only provide data on the immigrant population who had a place of birth outside Canada, the 1981 Census also recognizes that some persons born inside Canada may be classified as immigrants because they reported a year of immigration.

Residual Totals

In the Special Series, where remainder or residual totals are shown, the total may be equal to the province or territory total. The problem arises in Prince Edward Island, the Yukon and Northwest Territories where there are no census metropolitan areas. Consequently, some repetition of data is unavoidable. A similar situation exists for census tracts in the Basic Series, where the provincial census tract subtotal is equal to the province or territory total for the above-mentioned areas.

Rural Farm Population

It is quite probable that the counts for "rural farm population" are below the 1976 counterparts due to the more exclusive nature of the 1981 definition. For the 1981 Census "Rural Farm Population" refers to all persons living in rural areas who are members of the households of farm operators living on their farms for any length of time during the 12-month period prior to the census. Prior to the 1981 Census, rural farm population was defined as all persons living in rural areas in dwellings situated on census farms.

Schooling Data

Comparisons of the 1981 Census schooling data with past censuses or with other sources should generally be restricted to uniform characteristics, and to similar temporal and population components.¹ General comparisons that are made should take note of the fact that the 1981 schooling data, in contrast to that for previous census years, exclude inmates of institutions, and are reported only for the population 15 years and over, in contrast with 1971 and earlier censuses which reported schooling figures for the population 5 years and over. More specifically, there is one main aspect of the 1981 schooling data which distinguish it from other sources.

The main aspect of the 1981 Census schooling data where comparability is affected is in the "other non-university education" category. The other non-university education concept differs from previous censuses and from other measures of the so-called post-secondary non-university concept in two respects. First, in contrast to the 1976 Census, this question now relates to all university transfer courses of community colleges, and the CEGEP general of Quebec; therefore, a shift in the data from university to non-university can be expected and does indeed occur between 1976 and 1981 (especially for the CEGEP population). Second, the 1981 question has been broadly conceptualized to encompass all non-university schooling beyond elementary or secondary, regardless of secondary school graduation. The 1981 other non-university education concept covers a broad spectrum of schooling that includes the conventional post-secondary areas as well as other training in the trades and vocational areas.

¹ Users interested in historically comparable census education data for years 1971, 1976 and 1981 are referred to Special Bulletin, Catalogue No. 13-579: Historical Tables for Census Education Data: 1971, 1976 and 1981, to be released at a later date.

Standard Geographical Classification Codes

Due to a Statistics Canada policy of standardizing geographical codes wherever possible, census codes are no longer available. To uniquely identify any geostatistical area in Canada, it is necessary to employ the Standard Geographical Classification codes. For example, in 1976, a 4-digit census code uniquely identified census subdivisions within provinces. In 1981, it is necessary to use a 2-digit census division code plus a 3-digit census subdivision code to uniquely identify those census subdivisions.

Structural Type Data

The reporting of Structural Type of dwelling in any census or survey can be expected to be subject to potentially significant response error. This is perhaps due in part to the variety of sometimes complex structures, regional differences in terminology, and local real estate advertising. The level and nature of this error have been shown to vary according to the methodology used to collect the data. For the 1976 Census, the Structural Type was determined by the Census Representative. For the 1981 Census the Structural Type was determined by the respondent.

Analysis has shown that the 1976 data contained substantially fewer errors than the 1981 data for this variable. Comparisons between 1976 and 1981 Census data for Structural Type will therefore reveal certain inconsistencies. (Note: The count of dwellings is not in question, only how the total number of dwellings is broken down into Structural Type.) These inconsistencies will vary in degree from one geographic area to another and from one Structural Type to another.

Geographically the degree of error in dwelling classification is highest in the core areas of larger cities; those areas with older and converted or complex structures for which proper classification by respondents would be more difficult. The degree of error decreases as one moves outward from the core areas. Indeed there do not appear to be data quality problems in this regard for rural areas.

From the structural perspective the counts for Apartments in buildings with five or more storeys are believed to be relatively accurate. Counts for other types of dwellings in multiple unit structures (e.g., Apartments in buildings of less than five storeys and Row Houses), on the other hand, may contain varying degrees of error. For these dwellings there have been two types of misclassification. First, there are misclassifications among various types of the multiple unit structures. For example, Apartments in buildings of less than five storeys have frequently been classified as Row Houses, Semi-detached, etc. Second, there are some misclassifications between multiple and single structures. For example, a Duplex may have been misclassified as a Single Detached.

A substantial amount of the Structural Type error is misclassification among multiple unit structures. For this reason the user is advised to use the 1981 Census Structural Type data, whenever possible, by collapsing into four categories: Single Detached, Apartment in a building with five or more storeys, Movable (i.e. Mobile and Other Movable), and All Other. The error in the aggregated data will be reduced but it will not be eliminated. The misclassification of dwellings in multiple unit structures can be expected, where it occurs, to result in an underreporting for the "All Other" category and a compensating overreporting for Single Detached. The significance of this error (as a percentage) in the count of Single Detached can be expected to decrease as the proportion of true Single Detached in the geographic area increases.

The question is: "How can one determine the level of error in any given tabulation of Structural Type and is it possible to compensate or adjust for this error?". The answer will depend upon the tabulation and the specific use of the data.

For Enumeration Area level tabulations, for example, only the above general statements can be applied to the data. If the Enumeration Area is in a rural area, the data can be used with the same confidence as other data, with comparable cell sizes, for the Enumeration Area. On the other hand, if the Enumeration Area is in an urban core area with 50% of the reported dwellings in multiple unit structures, then the data on Structural Type would not be usable for any but the most general purposes, particularly for the full range of Structural Types.

For Census Tract, Census Subdivision, Census Division, Census Metropolitan Area, Province level tabulations, as examples, it is possible (with some cross-reference to other 1981 Census information and to 1976 Structural Type data) to determine whether for the particular tabulation there is a data quality problem for Structural Type, the degree of this problem, and most probably how the data have been misclassified.

The procedure is based upon Period of Construction data. These data, which were collected on a sample basis in the 1981 Census, permit the identification of new construction - i.e. of occupied dwellings constructed in the period 1976-1980 plus those constructed in the first five months of 1981. To the extent that dwelling stock is stable (ideally no conversions and no demolitions) over a five-year period, then adding the new construction - obtained from the 1981 Census data - to the 1976 Census Structural Type counts should yield values close to those for the 1981 Census. The degree to which these adjusted counts do not agree with 1981 counts by Structural Type should give a clear indication of the quality of the data - both 1981 and 1976.

Three basic steps are involved in making this assessment of the quality of the data:

- (1) Ascertain the 1976 Census geographic area corresponding to the 1981 Census geographic area for which Structural Type data are being tabulated.

For many tabulations the 1976 and 1981 Censuses will correspond exactly in geography. To assist in this determination the user may refer to a variety of bulletins.

(i) **Census Divisions and Census Subdivisions**

1976: 92-802 to 92-805; 92-911 (Reference Maps)

1981: 93-901 to 93-912, Table 4; 99-907 (Reference Maps -CDs/CSDs)

The magnitude of the area affected by a boundary change can be determined by comparing the 1976 and 1981 Reference Maps or by consulting the SGC manual Volume 1 (Appendix 2) Catalogue No. 12-567.

The magnitude of the population affected by a boundary change can be determined by comparing the adjusted 1976 population figure (i.e. based on 1981 area) reported in the 1981 bulletin with the final 1976 population figure reported in the 1976 bulletin.

(ii) **Census Metropolitan Areas**

1976: 92-809; 92-811 (Reference Maps)

1981: 95-903; 99-906 (Reference Maps - CMAs/CAs)

The magnitude of the area affected by a boundary change can be determined by comparing the 1976 and 1981 Reference Maps.

The magnitude of the population affected by a boundary change can be determined by comparing the adjusted 1976 population figure (i.e. based on 1981 area) reported in the 1981 bulletin with the final 1976 population figure reported in the 1976 bulletin.

(iii) **Census Agglomerations**

1976: 92-809; 92-811 (Reference Maps)

1981: 95-903; 99-906 (Reference Maps - CMAs/CAs)

Same as (ii) above except users should note that CAs experienced a change of definitional criteria between 1976 and 1981 that can greatly affect the CAs. These changes are over and above any changes to the boundaries of component CSDs.

(iv) **Census Tracts**

1976: 95-800 to 95-831 (Maps included)

1981: 95-905 to 95-940 (Maps included)

The magnitude of the area affected by a boundary change can be determined by comparing the 1976 and 1981 Reference Maps.

The magnitude of the population affected by a boundary change can be determined by comparing the adjusted 1976 population figure (i.e. based on 1981 area) reported in the 1981 bulletin with the final 1976 population figure reported in the 1976 bulletin.

(v) **Federal Electoral Districts**

The Federal Electoral District level data cannot easily be assessed for the reason that 1976 data follow the 1966 Representation Order, and 1981 data are according to the 1976 Representation Order, except for 1976 bulletin 92-808, which does present basic structural type information according to the 1976 Representation Order. The corresponding bulletin in 1981 is Catalogue No. 95-901.

Minor differences in geographic boundaries which cannot be isolated should not invalidate the assessment. Substantial differences, however, would preclude proper assessment. (e.g., the Enumeration Area level data cannot be assessed for the reason that Enumeration Area boundaries differ greatly between 1976 and 1981.)

- (2) Bring together, for the given geographic area (or areas), the 1976 and 1981 Structural Type data with the 1981 data cross-tabulated by Period of Construction (sample data) and produce "adjusted" 1981 counts.

For all Structural Types the newer construction (that with Period of Construction 1976-1981 or 1976-1980 plus 1981) reported in the 1981 Census must be added to the total for each Structural Type (or for some collapsed version) reported in 1976 to produce "adjusted" 1981 counts. Period of Construction data cross-tabulated with Structural Type are being specially prepared for use in carrying out this procedure. These tabulations will be available in March of 1983. Users of tape/fiche data should note that cross-tabulations of Period of Construction by Structural Type are planned at the Census Tract level (CTW81B22) and Census Subdivisions of 5,000 population and over (SPW81B13).

It should be noted that if there is no significant amount of new construction for the geographic area of interest (in which case the counts of total occupied private dwellings in 1981 and 1976 should be approximately equal) then Period of Construction data are not needed and this part of the procedure need not be applied.

- (3) Compare the 1981 Census counts by Structural Type with the adjusted 1981 Census counts by Structural Type and assess differences.

If the geographic areas being compared are identical, then the 1981 counts and the adjusted 1981 counts should be similar. (For this comparison the two 1981 Apartment categories must be added to be comparable to the 1976 count of Apartments.) There will be many cases for which there will be differences - some small and some large. What must be done is to make some judgement of the possible reasons for a discrepancy.

Possible Reasons for Differences

- (a) Dwellings constructed in the period January - May 1976 cannot be isolated in the 1981 data. Since occupied dwellings constructed in that period are included in the 1976 Census counts the adjusted 1981 counts will be higher than the published 1981 estimates.

If, in proportional terms, for any Structural Type there is a significant number of dwellings with Period of Construction of 1976-1981, then it may be necessary to readjust the counts to "correct" for the January - May 1976 construction. Without additional information, 5/60th of the 1976-1980 count or 5/65th of the 1976-1981 count should be subtracted from the earlier adjusted 1981 count. It should be remembered, however, that for small geographic areas such an adjustment may tend to be unreliable.

- (b) It must be remembered that the Period of Construction data are based upon a sample and as such are subject to sampling error. A discussion of the impact of sampling error will be given with any 1981 Census Bulletins which include tabulations of sample data (e.g. Period of Construction) and in the publication Data Quality - Sample Population (Catalogue No. 99-905). The sampling error for most tabulations should not be sufficient to invalidate the assessment procedure but will explain some amount of any differences.

- (c) The Period of Construction data are also subject to response error. The significance of such error for any given tabulations will depend upon the proportion of reported newer construction.
