Help text:

Tag: Perceived health

Perceived health is an indicator of overall health status. It can reflect aspects of health not captured in other measures, such as: incipient disease, disease severity, aspects of positive health status, physiological and psychological reserves and social and mental function. Perceived health refers to the perception of a person's health in general, either by the person himself or herself, or, in the case of proxy response, by the person responding. Health means not only the absence of disease or injury but also physical, mental and social well being.

This question should be answered regardless of whether or not this person is an Aboriginal person of North America.

Aboriginal people are usually those with ancestors who resided in North America prior to European contact and who identify with one of the three Aboriginal groups listed on the questionnaire: First Nations (North American Indian), Métis and Inuk.

Persons who consider themselves to be East Indian or Asian Indian, or who have ethnic roots on the subcontinent of India, should respond: "No, not an Aboriginal person" to this question.

Individuals who refer to themselves as Métis in the context of mixed ancestry, but who do not have North American Aboriginal ancestry-for example, those from Africa, the Caribbean and South America-should respond "No, not an Aboriginal person".

If respondent answers "mixed" or "bi-racial", or "multi-racial", etc probe for specific groups and mark each one separately (e.g. White, Black, Chinese). Aboriginal people or First Nations are not included in the list of response categories because the Employment Equity Act defines visible minorities as "persons, other than Aboriginal persons, who are non-Caucasian in race or non-white in "colour".
