Concepts and Definitions

Since the Canadian Tobacco Use Monitoring Survey is conducted over the telephone, easy to understand terminology is used throughout the questionnaire to avoid long explanations. Some standard concepts and definitions should be used in the analysis and interpretation of this data. The survey questions were designed with these definitions in mind.

Current Smoking Status

- 1) Daily smoker: A person who currently smokes cigarettes every day.
- 2) Non-daily smoker: A person who currently smokes cigarettes, but not every day.
- 3) Non-smoker: A person who currently does not smoke cigarettes.
- 4) Current smoker: A person who currently smokes cigarettes daily or occasionally.

Smoking History

- 1) Former smoker: A person who has smoked at least 100 cigarettes in his life, but currently does not smoke.
- 2) Experimental smoker: A person who has smoked at least one cigarette, but less than 100 cigarettes, and currently does not smoke cigarettes.
- 3) Lifetime abstainer: A person who has never smoked cigarettes at all.
- 4) Ever smoker: A person who is a current smoker or a former smoker.
- 5) Never smoker: A person who was an experimental smoker or who is a lifetime abstainer.

Smoking Prevalence

Proportion of population which smokes cigarettes at the current time.

True age versus roster age

Information about the respondent's age is obtained from two sources: from a household respondent who provided the age of all the household members (roster age), and later, at the end of the interview, directly from the individual respondent who is asked his/her birth date. The true age (DVAGE) is derived from the birth date, and only when the date is not available is the roster age used. Usually, there are some cases of discrepancy between the roster age and the true age. While roster age determines the flow of questions and the editing of the file, on the final edited file the age variables refer to true age.
