# General Social Survey, Cycle 18, 2004 [Canada]: Victimization, Main File (GSS, Cycle 18, 2004: Victimization, Main File)

*Enquête sociale générale, Cycle 18, 2004 [Canada] : Victimisation, Dossier principal*

Overview	
Type	General Social Survey
Identification	gss-12M0018-E-2002-c-18-m
Version	<p>Production Date: 2006 2.0</p> <p><u>Notes</u></p> <p>The documentation for the micro-data files for 18 has been modified. Please be advised that the documentation for the Public Use Microdata File (PUMF) for GSS-17 on Social Engagement and GSS-18 on Victimization has been modified. An error was detected and corrected in the documentation for the derived variable MARSTAT (marital status of respondent). The labels for codes 4 and 5 were incorrectly assigned for these two cycles. Code 4 should be "separated" and code 5 should be "divorced."</p>
Series	The two primary objectives of the General Social Survey (GSS) are: to gather data on social trends in order to monitor changes in the living conditions and well being of Canadians over time; and to provide information on specific social policy issues of current or emerging interest.
<p><b>Abstract</b></p> <p>The General Social Survey (GSS) program gathers data on social subjects in order to monitor changes in the living conditions and well being of Canadians over time and to provide immediate information on specific social policy issues of current or emerging interest. Cycle 18 of the GSS is the fourth cycle dedicated to the topic of victimization; previous cycles were carried out in 1988, 1993, and 1999. Content from Cycle 13 on senior abuse and public perception of alternatives to imprisonment was not repeated. New topics of interest were added including stalking, use of restraining orders and social disorder. Other subjects common to all four cycles include perceptions of crime, police and courts; crime prevention precautions; and accident and crime incident reports.</p>	
Kind of Data	Survey data, microdata file
Unit of Analysis	Individuals

## Scope & Coverage

### Scope

A supplementary survey was conducted in the three territories. This supplementary survey used the same questionnaire, collection methodology, and interviewers as the main survey, but The main sample of GSS-18 was distributed over the ten provinces, and a supplementary survey was conducted in the three territories. This supplementary survey used the same questionnaire, collection methodology, and interviewers as the main survey, but used a different methodology for sample selection. The data from this supplementary survey are not included in this microdata file, but are available in the RDCs.

Keywords	Abuse, Alcohol, Assault, Age, Crime, Custody, Discriminatory, Divorce, Education, Employment, Family, Help, Household, Income, Injuries, Institution, Legal, Living Arrangements, Marital Status, Medication, Neighbours, Offender, Occupation, Parent, Police, Property, Residence, Reporting, Relationships, Safety
Time Period(s)	2004
Countries	Canada

### Geographic Coverage

Canada, provinces

**Universe**

Included: All individuals aged 15 and over living in Canada.

Excluded: Residents of the Yukon, Northwest Territories, and Nunavut, and full-time residents of institutions.

**Producers & Sponsors**

<b>Primary Investigator(s)</b>	Statistics Canada
<b>Other Producer(s)</b>	Statistics Canada

**Sampling****Sampling Procedure**

Data for Cycle 18 of the GSS were collected in seven waves starting in January 2004 and ending in December 2004. The sample was evenly distributed over the seven waves to counterbalance as much as possible the seasonal variation in the information gathered. Households were selected for the survey by Random Digit Dialing. The telephone numbers in the sample were selected using the Elimination of Non-Working Banks technique. This sampling technique is a method in which an attempt is made to identify all working banks for an area (i.e., to identify all sets of 100 telephone numbers with the same first eight digits containing at least one number that belongs to a household). Thus, all telephone numbers within non working banks are eliminated from the sampling frame.

In order to carry out sampling, each of the ten provinces was divided into strata, i.e. geographic areas.

Many of the Census Metropolitan Areas (CMAs) were each considered separate strata. This was the case for St. John's, Halifax, Saint John, Montreal, Quebec City, Toronto, Ottawa, Hamilton, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Vancouver and Victoria. CMAs not on this list are located in Quebec and Ontario. Two more strata were formed by grouping the remaining CMAs in each of these two provinces. Finally, the non-CMA areas of each of the ten provinces were also grouped to form ten more strata. This resulted in 27 strata in all.

**Response Rate**

The overall response rate during collection for Cycle 18 was 74.5%.

**Weighting**

Three weighting factors were placed on the Main File. They are listed and explained below: <br />

**WGHT\_PER:** This is the basic weighting factor for analysis at the person level, i.e. to calculate estimates of the number of persons (non-institutionalized and aged 15 or over) having one or several given characteristics. WGHT\_PER should be used for all person-level estimates.

**WGHT\_HSD:** This weighting factor can be used to estimate the number of households with a given characteristic. For example, to estimate the number of households that live in low-rise apartments, WGHT\_HSD should be summed over all records with this characteristic.

**WGHT\_ABU:** This weighting factor is required to estimate the number of victimization incidents that occurred over the past 12 months within certain violent relationships, namely those with spousal or ex-spousal violence. It should therefore only be used for estimates involving variables PR\_101\_2004 and PR\_304\_2004.

Note that some series reports involve a large number of similar incidents. Some analysts may feel that leaving them as is will lead to a disproportionate contribution to victimization estimates from this type of incident. Indeed, the series factor was capped at 3 for estimates published in this user's guide. If analysts wish to use the same cap for the series factor, they may use the weighting factor ADJWTVIC, which is WGHT\_VIC multiplied by the capped (at 3) series factor. In the above example, to estimate the total number of break and enter incidents reported to police, with any series reports capped at 3, ADJWTVIC would be summed over all records representing a break and enter incident that was reported to the police. Note also that violence by a current or ex-spouse is only captured in abuse reports on the Main File. Suppose a given estimate of a number of victimization incidents is to include violence of this type. Then the number of victimization incidents involving this type of violence must be calculated from the Main File separately and then added to the estimate from the Incident File. More information and examples of these kinds of estimates can be found in Section 7.6.

<b>Data Collection</b>	
<b>Data Collection Dates</b>	start 2004-01 end 2004-12
<b>Data Collection Mode</b>	Computer assisted telephone interviewing  The samples for most GSS cycles are selected using random digit dialing telephone methods and the interviews are conducted by telephone. Thus persons in households without telephones cannot be interviewed. However, persons living in such households represent less than 2% of the target population. Interviews are not conducted by cellular telephone so persons with only cellular telephone service are also excluded; again, this group makes up a very small proportion of the population, less than 3%.
<b>Data Collection Notes</b> Responding to this survey is voluntary. Data are collected directly from survey respondents.   The Main File contains questionnaire responses and associated information from 23,766 respondents. Characteristics on this file concern the person as opposed to information about any individual victimization incidents which he or she may have experienced.	

<b>Data Processing &amp; Appraisal</b>	
<b>Other Processing</b>	Computer assisted telephone interviewing (CATI) was used to collect data for the GSS, using Random Digit Dialing methods. Respondents were interviewed in the official language of their choice. Interviews by proxy were not allowed. Data collection began in January 2004 and continued through to December 2004. The sample was evenly distributed over the seven waves to counterbalance as much as possible the seasonal variation in the information gathered.
<b>Estimates of Sampling Error</b>	As the data are based on a sample of persons they are subject to sampling error. That is, estimates based on a sample will vary from sample to sample, and typically they will be different from the results that would have been obtained from a complete census. The potential range of this difference has been estimated for key data and used to produce tables that can be used to estimate the sampling variability of many estimates. These tables and instructions for and examples of their use are found in Appendix A and Section 8 of the Public Use Microdata File Documentation and User's Guide.

<b>Accessibility</b>	
<b>Distributor(s)</b>	Data Liberation Initiative
<b>Access Conditions</b>	DLI License
<b>Citation Requirements</b>	The publishing of analysis and results from research using any of the data products is permitted in research communications such as scholarly papers, journals and the like. The authors of these communications are required to cite Statistics Canada as the source of the data, and to indicate that the results or views expressed are those of the author/authorized user and are not those of Statistics Canada. Permission to include extracts of these data in textbooks must be obtained from the Licencing Section of Statistics Canada's Marketing Division.

Literal question	During the past 5 years, did you ever contact or use any of the following services for help because of the violence, such as: ... victim services or victim witness assistance programs?			
Interviewer's instructions	Victim Services vary depending on which system offers it (police/justice and community). In general, police services help victims while in touch with the police. Justice or police system services help victims as their cases proceed through the justice system (police, courts and corrections). Services include providing general information about the justice system, referrals, assistance with court, help preparing victim impact statements, offering casespecific information, emotional support and providing information to help victims recover financial losses resulting from the crime. Assistance to victims and witnesses can also be available through the prosecution phase. Support is also available in certain provinces to victims who decide not to enter into the criminal justice system. Community-based services provide assistance to victims of crime. See help screen for examples and notes per province.

# MSVIC: Most serious victimization reported by respondent in the past 12 months - excludes spousal and ex-spousal abuse.				
Information	[Type= discrete] [Format=numeric] [Range= 101-813] [Missing=*]			
Statistics [NW/ W]	[Valid=5952 / 6797806.133 ] [Invalid=17814 / 19102837.923 ]			
Universe	All respondents.			
Literal question	Most serious victimization reported by respondent in the past 12 months - excludes spousal and ex-spousal abuse.			
Notes	Source: General Social Survey, 2004, derived from MSCRIME.  1.Spousal/ex-spousal abuse includes those cases where the spouse or ex-spouse is the offender. 2.The difference between the frequency count for MSVIC = "997" (17,552) and TOTVIC = "0" (17,550) is a valid difference. While MSVIC is derived from MSCRIME in the incident file, TOTVIC is derived from CVS_TOT_INCIDENTS in the main file. Two respondents, who each reported more than 10 incidents via one screening question in the main file, reported ten "out-of-scope" incidents in the incident file. The difference arises because, while the 10 incidents reported on the incident file were determined to be out-of-scope, we do not presume that the incidents beyond 10 (for which we did not ask any details) are out-of-scope. Consequently, these two respondents are counted as having been victimized using TOTVIC and as having reported "no crime" (in the past 12 months) using MSVIC.
