## 1 INTRODUCTION

The National Survey of Giving, Volunteering and Participating was conducted by Statistics Canada in November 1997 in partnership with the Canadian Centre for Philanthropy, Canadian Heritage, Health Canada, Human Resources Development Canada, the Non-Profit Sector Research Initiative, and Volunteer Canada. This manual has been produced to facilitate the manipulation of the microdata file of the survey results.

Any questions about the data set or its use should be directed to:

Statistics Canada

## **2 BACKGROUND**

The charitable and volunteer sector is an important part of Canada's social terrain, but little is known about the composition or dynamics of this sector. Statistics Canada has previously conducted two National Surveys on Volunteering. The first was a modest supplement to the Labour Force Survey in February 1980; the second, conducted in November 1987, provided a first detailed portrait of volunteer activity in Canada.

However, to date there has been no systematic statistical program encompassing all dimensions of individual contributory behaviour including volunteering, charitable giving and civic participation. In and of itself, timely data is crucial in providing information on this key component of Canada's social capital and on the impact this has on the capacity and vitality of the third sector. Furthermore, in a period of financial cutbacks and government and private sector downsizing this information is paramount in providing valid information to aid decision makers in understanding the full implications of programs and service reductions on the Canadian public.

In recognition of this need, a collaborative partnership was formed involving the Canadian Centre for Philanthropy, Canadian Heritage, Health Canada, Human Resources Development Canada, the Non-Profit Sector Research Initiative, Statistics Canada and Volunteer Canada. The objectives of the partnership are: 1) to deliver information about contributory behaviours of Canadians to a diverse audience; and 2) to build a long-term systematic statistical program on contributory behaviours. To this end, The 1997 National Survey of Volunteer, Giving and Participating (NSVGP) was developed.

### **3 OBJECTIVES**

The objectives of the NSVGP are twofold: 1) to collect national data to fill a void of information about individual contributory behaviours including volunteering, charitable giving and civic participation; and 2) to inform public policy decisions that relate to the charitable and volunteer sector.

## 4 CONCEPTS AND DEFINITIONS

This chapter outlines concepts and definitions of interest to the users. The concepts and definitions used in the Labour Force Survey are described in section 4.1 while those specific to the National Survey of Giving, Volunteering and Participating are given in section 4.2.

### 4.1 Labour Force Survey Concepts and Definitions

#### Labour Force Status

Status of the respondent in the labour market : a member of the non-institutional population 15 years and over is designated as either **employed**, **unemployed** or **not in the labour force**.

#### Employed

Employed persons are those who, during the reference week:

- (a) did any work<sup>1</sup> at all
- (b) had a job but were not at work due to:
  - own illness or disability
  - personal or family responsibilities
  - bad weather
  - labour dispute
  - vacation
  - other reason not specified above (excluding persons on layoff and persons whose job attachment was to a job starting at a definite date in the future).

#### Unemployed

Unemployed persons are those who, during the reference week:

- (a) were without work, had actively looked for work in the past four weeks (ending with reference week), and were available for work<sup>2</sup>;
- (b) had not actively looked for work in the past four weeks but had been on layoff<sup>3</sup> and were available for work;
- (c) had not actively looked for work in the past four weeks but had a new job to start in four weeks or less from the reference week, and were available for work.

---

<sup>1</sup> Work includes any work for pay or profit, that is, paid work in the context of an employer-employee relationship, or self-employment. It also includes unpaid family work where unpaid family work is defined as unpaid work which contributed directly to the operation of a farm, business or professional practice owned or operated by a related member of the household. Such activities may include keeping books, selling products, waiting on tables, and so on. Tasks such as housework or maintenance of the home are not considered unpaid family work.

<sup>2</sup> Persons in this group meeting the following criteria are regarded as available:

- (i) were full-time students seeking part-time work who also met condition (ii) below. (Full-time students looking for full-time work are classified as not available for work in the reference week.)
- (ii) reported that there was no reason why they could not take a job in reference week, or if they could not take a job it was because of "own illness or disability", "personal or family responsibilities", or "already had a job".

<sup>3</sup> Persons are classified as being on layoff only when they expect to return to the job from which they were laid off.

### Not in the Labour Force

Those persons in the civilian non-institutional population 15 years of age and over who, during the reference week, were neither employed nor unemployed.

### Industry and Occupation

The Labour Force Survey provides information about the occupation and industry attachment of employed and unemployed persons, and of persons not in the labour force who have held a job in the past five years. Since 1984, these statistics have been based on the 1980 Standard Occupational Classification and the 1980 Standard Industrial Classification. Prior to 1984, the 1971 Standard Occupational Classification and the 1970 Standard Industrial Classification were used.

### Reference week

Entire calendar week covered by the Labour Force Survey each month. It is usually the week containing the 15th day of the month. The interviews are conducted during the following week, called the Survey Week, and the labour force status determined is that of the reference week.

### Full-time

Full-time employment consists of persons who usually work 30 hours or more per week, plus those who usually work less than 30 hours but consider themselves to be employed full-time (e.g. airline pilots).

### Part-time

Part-time employment consists of all other persons who usually work less than 30 hours per week.

## **4.2 National Survey of Giving, Volunteering and Participating Concepts and Definitions**

### Cash donation

Refers to a donation of cash made to a charitable or non-profit organization. Three types of cash donations were measured:

- (1) *Financial donation* refers to a cash donation made in response to, or by approaching a charitable or non-profit organization.
- (2) *Cash box donation* refers to depositing spare change in cash boxes usually located beside a cash register at store check-outs.
- (3) *Leaving a bequest* which involves leaving a cash donation to a charitable or non-profit organization in one's will.

### Charitable giving

Encompasses the following types of charitable giving which were measured in this survey: cash donations, in-kind donations and indirect financial support.

### Donor

Any person who made donations of money to a charitable or non-profit organization during the 12-month period preceding the survey

### Indirect financial support

This survey also measured individuals participation in supporting charitable and non-profit organizations through indirect financial support. Indirect financial support includes purchasing goods such as chocolate bars or coupon books where the proceeds go to a charitable organization, purchasing charity-sponsored raffle or lottery tickets, and gaming in charity sponsored bingos or casinos.

### In- Kind Donations

Are non-monetary donations made to a charitable or non-profit organization. Examples include donations of clothing or household items and donations of food.

### Volunteer

Any individual who volunteered, i.e. , who willingly performed a service without pay, through a group or organization during the 12-month reference period preceding the survey.

### Other types of giving

The NSGVP also asked questions about financial support given to people directly, not through an organization. Individuals were asked about whether they had given money to relatives living outside of their household, homeless people or others living outside of their household.

### Other ways of helping people

The NSGVP also asked individuals about a variety of ways in which they provided help to others directly, not through the structure of an organization. This type of help refers to help given to individuals living outside of the respondents household.

### Participating

Refers to being a member or a participant in any of the following types of organizations: work related; sports or recreation; religious affiliated; community or school related; cultural, educational, or hobby related; service club or fraternal organization; and political.

### Organization classification

Respondents were asked to provide information on the organizations for which they volunteered and to which they made donations. Respondents were first asked to provide the name of the organization. A pick-list of common organizations was used. If the organization cited by the respondent was not on this pick-list, the respondent was then asked to provide information about what this organization does. This information was then used to group organizations into broad categories.

The International Classification of Nonprofit Organizations (ICNPO) Revision 1, developed by the Johns Hopkins Comparative Nonprofit Sector Project, was used to code organizations. A major advantage of the ICNPO system is that it is used widely by other countries and thus allows for international comparisons. The ICNPO system groups organizations into 12 Major Activity Groups, including a catch-all "Not Elsewhere Classified" category. These 12 Major Activity Groups are further subdivided into 24 sub-groups. The groups are as follows:

1. *Culture and Recreation*: includes organizations and activities in general and specialized fields of culture and recreation. Three sub-groups of organizations are included in this group: (1) culture and arts (i.e., media and communications; visual arts, architecture, ceramic art; performing art; historical, literary and humanistic societies; museums; and zoos and aquariums); (2) sports; and (3) other recreation and social clubs (i.e., service clubs and recreation and social clubs).

2. *Education and Research*: includes organizations and activities administering, providing, promoting, conducting, supporting and servicing education and research. Four sub-groups are contained in this group: (1) primary and secondary education organizations; (2) higher education organizations; (3) organizations involved in other education (i.e., adult/continuing education and vocational/technical schools); and 4) organizations involved in research (i.e., medical research, science and technology, and social sciences)

3. *Health*: includes organizations that engage in health-related activities, providing health care, both general and specialized services, administration of health care services, and health support services. Four sub-groups are included in this category: (1) hospitals and rehabilitation; (2) nursing homes; (3) mental health and crisis intervention; and (4) other health services (i.e., public health and wellness education, out-patient health treatment, rehabilitative medical services, and emergency medical services).

4. *Social Services*: includes organizations and institutions providing human and social services to a community or target population. Three sub-groups are contained in this category: (1) social services (including organizations providing services for children, youth, families, the handicapped and the elderly, and self-help and other personal social services; (2) emergency and relief; and income support and maintenance.

5. *Environment*: includes organizations promoting and providing services in environmental conservation, pollution control and prevention, environmental education and health, and animal protection. Two sub-groups are included in this category: environment and animal protection.

6. *Development and Housing*: includes organizations promoting programs and providing services to help improve communities and promote the economic and social well-being of society. Three sub-groups are included in this category: (1) economic, social and community development (including community and neighbourhood organizations); (2) housing; and (3) employment and training.

7. *Law, Advocacy and Politics*: includes organizations and groups that work to protect and promote civil and other rights, advocate the social and political interests of general or special constituencies, offer legal services and that promote public safety. Three sub-groups are contained in this category: (1) civic and advocacy organizations; (2) law and legal services; and (3) political organizations.

8. *Philanthropic Intermediaries and Voluntarism*: includes philanthropic organizations and organizations promoting charity and charitable activities including grant-making foundations, voluntarism promotion and support, and fund-raising organizations.

*9. International:* includes organizations promoting cultural understanding between peoples of various countries and historical backgrounds and also those providing relief during emergencies and promoting development and welfare abroad.

*10. Religion:* organizations promoting religious beliefs and administering religious services and rituals; includes churches, mosques, synagogues, temples, shrines, seminaries, monasteries and similar religious institutions, in addition to related organizations and auxiliaries of such organizations.

*11. Business and professional associations, Unions :* includes organizations promoting, regulating and safeguarding business, professional and labour interests.

*12. Groups not elsewhere classified*

## 5 SURVEY METHODOLOGY

The National Survey of Giving, Volunteering and Participating was administered in November 1997 to a sub-sample of the dwellings in the Labour Force Survey (LFS) sample, and therefore its sample design is closely tied to that of the LFS. The LFS design is briefly described in Sections 5.1 to 5.4<sup>4</sup> Sections 5.5 and 5.6 describe how the National Survey of Giving, Volunteering and Participating departed from the basic LFS design in November 1997.

### **5.1 Population Coverage**

The LFS is a monthly household survey whose sample of individuals is representative of the civilian, non-institutionalized population 15 years of age or older in Canada's ten provinces. Specifically excluded from the survey's coverage are residents of the Yukon and Northwest Territories, persons living on Indian Reserves, full-time members of the Canadian Armed Forces and inmates of institutions. These groups together represent an exclusion of approximately 2% of the population aged 15 or over.

### **5.2 Sample Design**

The LFS sample is based upon a stratified, multi-stage design employing probability sampling at all stages of the design. The design principles are the same for each province. A diagram summarizing the design stages appears at the end of this section.

#### **5.2.1 Primary Stratification**

Provinces are first stratified into economic regions - geographic areas of more or less homogeneous economic structure formed on the basis of federal provincial agreements. Economic regions are relatively stable over time.

These economic regions are treated as primary strata and further stratification is carried out within them (see section 5.2.3).

---

<sup>4</sup> A detailed description of the LFS design is available in the Statistics Canada publication entitled **Methodology of the Canadian Labour Force Survey, 1984-1990** (catalogue #71-526).

## **5.2.2 Types of Areas**

Economic regions are further disaggregated into 3 categories: self-representing areas (SRU's), non-self-representing areas (NSRU's) and special areas. Generally SRU's are urban areas whose population as of the 1981 Census exceeds 15,000 persons or whose unique labour force characteristics demand their establishment as SRU's. For the most part, SRU boundaries are coincident with delineations established for the Census.

All SRU's in each economic region are included in the survey and, as the name implies, each is represented by its own sample.

NSRU's are the areas lying outside the SRU's and they consist largely of small urban centres and rural areas. Each economic region contains one NSRU which is represented by its own sample.

A small proportion (approximately 1%) of the LFS population is found in institutions (for example, live-in staff of hospitals or schools or permanent residents of hotels or motels), on military bases (civilian personnel only) or in remote areas of provinces which are not readily accessible to LFS interviewers. For administrative purposes, this portion of the population is sampled separately through the special area frame. This portion of the sample is selected on a province-wide basis, without reference to the stratification used for SRU and NSRU areas.

## **5.2.3 Secondary Stratification**

SRU areas are next individually delineated into design strata, which reflect areas of similar socio-economic status as identified in the 1981 Census. The extent of the stratification (i.e. number of strata) depends upon the size of the SRU.

In economic regions in which the NSRU population constitutes a significant proportion of the economic region population, the NSRU is next delineated into separate urban and rural strata. Within each of these strata, further stratification is carried out to reflect differences on a number of labour force characteristics.

In special areas, strata are formed on a province-wide basis. The strata reflect the main types of special groups in the population which require special administrative sampling procedures. These are: military establishments, institutions and remote areas.

## **5.2.4 Cluster Delineation and Selection**

Within each of the secondary strata found in SRU areas, a number of geographic contiguous groups of dwellings, or clusters, are formed based upon a combination of 1981 Census counts and field enumeration. These clusters generally are coincident with city blocks or block faces. The selection of a sample of clusters (generally 6 or 12 clusters) from each of these secondary strata represents the first stage of sampling in SRU areas.

Within each of the secondary strata in NSRU areas, a number of large geographic areas are delineated in such a way that each one reflects the composition of the stratum within which it is located with respect to a number of socio-economic characteristics. Two or four of these areas, known as primary sampling units (or PSU's) are selected into the sample from each secondary stratum. Within each selected PSU, a number of smaller geographically contiguous groups of dwellings, or clusters, are then formed using well-defined physical features which are recognizable both on maps and in the field.

In special areas, census enumeration areas (geographic areas covered by individual enumerators for the Census) represent the first stage of selection. Within those selected, where necessary, geographically contiguous groups of dwellings or clusters are formed and the selection of a sample of these represents the second stage of sampling.

#### **5.2.5 Dwelling Selection**

In all three types of areas (SRU, NSRU and special areas) selected clusters are first visited by enumerators in the field and a listing of all private dwellings in the cluster is prepared. From the listing a sample of 6 dwellings (on average) is then selected. This represents the final stage of sampling.

In the 17 largest SRU's, a sample of apartments in large apartment buildings is selected from a separate register based upon information supplied by CMHC. The purpose of this is to ensure better representation of apartment dwellers in the sample as well as to minimize the effect of growth in clusters, due to construction of new apartment buildings.

#### **5.2.6 Person Selection**

Demographic information is obtained for all persons for whom the selected dwelling is the usual place of residence. LFS information is obtained for all civilian household members 15 years of age or older.

### **5.3 Sample Size**

The sample size of eligible persons in the LFS is determined so as to meet the statistical precision requirements for various labour force characteristics at the provincial and subprovincial level, to meet the requirements of federal, provincial and municipal governments as well as a host of other data users.

The monthly LFS sample consists of approximately 73,000 dwellings. After excluding dwellings found to be vacant, dwellings demolished or converted to non-residential uses, dwellings containing only ineligible persons, dwellings under construction, and seasonal dwellings, about 63,000 dwellings remain which are occupied by one or more eligible persons. From these dwellings, LFS information is obtained for approximately 122,000 civilians aged 15 or over.

### **5.4 Sample Rotation**

The LFS employs a panel design whereby the entire monthly sample of dwellings consists of 6 panels, or rotation groups, of approximately equal size. Each of these panels can be considered by itself to be representative of the entire LFS population. All dwellings in a rotation group remain in the LFS sample for 6 consecutive months after which time they are replaced (rotated out of the sample) by a new panel of dwellings selected from the same or similar clusters.

This rotation pattern was adopted to ensure that the sample of dwellings constantly reflects changes in the current housing stock and to minimize any problems of non-response or respondent burden that would occur if households were to remain in the sample for longer than 6 months. It also has the statistical advantage of providing a common sample base for short-term month-to-month comparisons of LFS characteristics.

Because of the rotation group feature, it is possible to readily conduct supplementary surveys using the LFS design but employing less than the full size sample.

### **5.5 Modifications to the L.F.S design for the Supplement**

The National Survey of Giving, Volunteering and Participating used five of the six rotation groups in the November 1997 LFS sample. Like, the LFS, the coverage for the National Survey of Giving, Volunteering and Participating, included civilians aged 15 years of age and older. However, unlike the LFS where information is collected for all eligible household members, the National Survey of Giving, Volunteering and Participating only collected information from one pre-selected household member and proxy responses were not permitted

## **5.6 Sample size by Province for the Supplement**

The following table shows the number of households in the LFS sampled rotations who were eligible for the National Survey of Giving, Volunteering and Participating supplement. This tables excludes the 797 household which were non-respondents to the LFS.

PROVINCE	SAMPLE SIZE
Newfoundland	1,573
Prince Edward Island	1,170
Nova Scotia	2,930
New Brunswick	2,618
Quebec	8,878
Ontario	13,208
Manitoba	3,141
Saskatchewan	2,883
Alberta	3,306
British Columbia	3,949
CANADA	44,452

## **6 DATA COLLECTION**

Data collection for the LFS is carried out each month during the week following the LFS reference week, usually the third week of the month.

### **6.1 Interviewing for the LFS**

Statistics Canada interviewers, who are part-time employees hired and trained specifically to carry out the LFS, contact each of the sampled dwellings to obtain the required labour force information. Each interviewer contacts approximately 70 dwellings per month.

Dwellings new to the sample are contacted through a personal visit. The interviewer first obtains socio-demographic information for each household member and then obtains labour force information for all eligible members. Provided there is a telephone in the dwelling and permission has been granted, subsequent interviews are conducted by telephone. As a result, approximately 85% of all dwellings are interviewed by telephone. In these subsequent monthly interviews, as they are called, the interviewer confirms the socio-demographic information collected in the first month and collects the labour force information for the current month.

In all dwellings, information about all household members is obtained from a knowledgeable household member - usually the person at home when the interviewer calls. Such 'proxy' reporting, which accounts for approximately 55% of the information collected, is used to avoid the high cost and extended time requirements that would be involved in repeat visits or calls necessary to obtain information directly from each respondent.

At the conclusion of the LFS monthly interviews, interviewers introduce the supplementary survey, if any, to be administered to some or all household members that month.

If, during the course of the six months that a dwelling normally remains in the sample, an entire household moves out and is replaced by a new household, information is obtained about the new household for the remainder of the six-month period.

### **6.2 Supervision and Control**

All LFS interviewers are under the supervision of a staff of senior interviewers who are responsible for ensuring that interviewers are familiar with the concepts and procedures of the LFS and its many supplementary surveys, and also for periodically monitoring their interviewers and reviewing their completed documents. The senior interviewers are, in turn, under the supervision of the LFS program managers, located in each of the 8 Statistics Canada regional offices.

### **6.3 Non-Response to the LFS**

Interviewers are instructed to make all reasonable attempts to obtain LFS interviews with members of eligible households. For individuals who at first refuse to participate in the LFS, a letter is sent from the Regional Office to the dwelling address stressing the importance of the survey and the household's cooperation. This is followed by a second call (or visit) from the interviewer. For cases in which the timing of the interviewer's call (or visit) is inconvenient, an appointment is arranged to call back at a more convenient time. For cases in which there is no one home, numerous call backs are made. Under no circumstances are sampled dwellings replaced by other dwellings for reasons of non-response.

Each month, after all attempts to obtain interviews have been made, a small number of non-responding households remain. For households non-responding to the LFS and for which LFS information was obtained in the previous month, this information is brought forward and used as the current month's LFS information. No supplementary survey information is collected for these households.

#### **6.4 Data Collection Modifications for National Survey of Giving, Volunteering and Participating**

The National Survey of Giving, Volunteering and Participating was administered to one randomly selected individual per household. The random selection was carried out after the LFS survey was completed .

Upon completion of the Labour Force Survey interview, the interviewer asked to speak to the randomly selected person for the National Survey of Giving, Volunteering and Participating. If the selected person was not available, the interviewer arranged for a convenient time to phone back. Proxy response was not allowed, hence the collection period was extended by one week to allow the interviewers time to contact the pre-selected individuals.

Further sub-sampling was carried out on respondents who were not volunteers. After completion of the first set of NSGVP questions relating to volunteer activities, respondents who were not volunteers had a 65% chance of being dropped from the survey which was determined by a pre-programmed random selection process. Consequently, 15,832 respondents who were not volunteers were screened out of the survey. While these respondents were used in calculating the response rates, they are not included in the final data file.

#### **6.5 Non-Response to the National Survey of Giving, Volunteering and Participating**

For households responding to the LFS (43,656 of 44,452 households), the next stage of data collection was to administer the National Survey of Giving, Volunteering and Participating. In total, 44,452 individuals were eligible for the supplementary survey, 796 households were non-responses to the LFS and thus were not contacted for the NSGVP. The National Survey of Giving, Volunteering and Participating interview was fully completed for 34,806 of these individuals for a response rate of 78.3% Of those who responded, 15,832 non-volunteers were screened out of the survey. More detailed information on response rates is presented in Chapter 8 (Data Quality).

## **7 DATA PROCESSING**

The main output of the National Survey of Giving, Volunteering and Participating is a "clean" microdata file. This section presents a brief summary of the processing steps involved in producing this file.

### **7.1 Data Capture**

Capture of survey data was accomplished using minicomputers located in each of Statistics Canada's Regional Offices. During this process any document containing at least one interviewer-completed item was captured and an unedited version of the computer record was electronically transmitted to Ottawa for further processing. In total 35,787 documents were captured and transmitted for the survey. Of these, 15,832 documents pertained to non-volunteers who were screened out of the survey and thus whose records were eliminated. A further 981 records were for respondents who did not fully complete the questionnaire and thus were treated as non-response. And an additional 673 records were excluded as they represented respondents who refused to share their information with other NSGVP partner aside from Statistics Canada.

### **7.2 Editing**

The first stage of survey processing undertaken at head office was the replacement of any 'out-of-range' values on the data file with blanks. This process was designed to make further editing easier.

The first type of error treated was errors in questionnaire flow, where questions which did not apply to the respondent (and should therefore not have been answered) were found to contain answers. In this case a computer edit automatically eliminated superfluous data by following the flow of the questionnaire implied by answers to previous, and in some cases, subsequent questions.

The second type of error treated involved a lack of information in questions which should have been answered. Errors of this type were flagged in a computer edit and responses imputed from a similar record matched on a set of characteristics deemed to be related to the missing items. When this was not possible and the record still had missing data, a non-response or "not stated" code was assigned to the item. For this type of error, a non-response or "not-stated" code was assigned to the item.

### **7.3 Coding of open-ended questions**

A few data items on the questionnaire were recorded by interviewers in an open-ended format. A total of 8 partially or completely open-ended questions were included in the survey. These were items relating to organization information for which an individual volunteered or to whom an individual made a donation. An “Other, specify” category was asked for type of volunteer activity, type of employer support received for volunteering, other type of donation made, ethnicity, and religious affiliation.

Open-ended questions relating to organization information was used to classify organizations into categories based on the International Classification for Non-Profit Organizations (ICNPO) structure. Please see section 4.2 for further details on organization classification.

For open-ended questions relating to “Other, specify” categories, the text was coded back to an existing category, where one existed. In cases, where there was a high enough frequency, another category was created and “Other, specify’s” were coded to a newly created category.

### **7.4 Creation of Derived Variables**

A number of data items on the microdata file have been derived by combining items on the questionnaire in order to facilitate data analysis. The first two letters of derived variables begin with DV. Examples of derived variables include: total number of volunteer events and total hours volunteered for the 12 organization types (derived from the volntr file and put on the SGVP file); total number of donations and total amount of donations for the 12 organization types (derived from the GIVE file and put on the SGVP file); and total number of donations and total amount of donations by solicitation method (derived from the GIVE file and put on the SGVP file).

### **7.5 Weighting**

The principle behind estimation in a probability sample such as the LFS is that each person in the sample "represents", besides himself or herself, several other persons not in the sample. For example, in a simple random 2% sample of the population, each person in the sample represents 50 persons in the population.

The weighting phase is a step which calculates, for each record, what this number is. This weight appears on the microdata file, and **must** be used to derive meaningful estimates from the survey. For example, if the number of individuals who volunteered during the past 12 months is to be estimated, it is done by selecting the records referring to those individuals in the sample with that characteristic and summing the weights entered on those records.

Details of the method used to calculate these weights are presented in Chapter 11.

### **7.6 Suppression of Confidential Information**

It should be noted that the 'Public Use' microdata files described above differ in a number of important respects from the survey 'master' files held by Statistics Canada. These differences are the result of actions taken to protect the anonymity of individual survey respondents. In cases variables where were deemed to jeopardize the anonymity of the

respondent, the variable has either been collapsed or suppressed on the micro data file. Variables for which this occurs are identified in the attached univariates. Users requiring access to information excluded from the microdata files may purchase custom tabulations. Estimates generated will be released to the user, subject to meeting the guidelines for analysis and release outlined in Section 9 of this document.

## 8 DATA QUALITY

### 8.1 Response Rates

The following table summarizes the response rates to the National Survey of Giving, Volunteering and Participating.

	Response Rate (1)
Newfoundland	83.4%
Prince Edward Island	81.2%
Nova Scotia	81.6%
New Brunswick	78.7%
Québec	80.2%
Ontario	77.1%
Manitoba	79.7%
Saskatchewan	79.1%
Alberta	74.2%
British Columbia	73.8%
CANADA	78.3%

Note:

- (1) Response rate is number of individuals responding to NSGVP as a percentage of number of individuals responding to the LFS in rotations sampled.

### 8.2 Survey Errors

The survey produces estimates based on information collected from and about a sample of individuals. Somewhat different estimates might have been obtained if a complete census had been taken using the same questionnaire, interviewers, supervisors, processing methods, etc. as those actually used in the survey. The difference between the estimates obtained from the sample and those resulting from a complete count taken under similar conditions is called the sampling error of the estimate.

Errors which are not related to sampling may occur at almost every phase of a survey operation. Interviewers may misunderstand instructions, respondents may make errors in answering questions, the answers may be incorrectly entered on the questionnaire and errors may be introduced in the processing and tabulation of the data. These are all examples of non-sampling errors.

Over a large number of observations, randomly occurring errors will have little effect on estimates derived from the survey. However, errors occurring systematically will contribute to biases in the survey estimates. Considerable time and effort was made to reduce

non-sampling errors in the survey. Quality assurance measures were implemented at each step of the data collection and processing cycle to monitor the quality of the data. These measures included the use of highly skilled interviewers, extensive training of interviewers with respect to the survey procedures and questionnaire, observation of interviewers to detect problems of questionnaire design or misunderstanding of instructions, procedures to ensure that data capture errors were minimized and coding and edit quality checks to verify the processing logic.

A major source of non-sampling errors in surveys is the effect of non-response on the survey results. The extent of non-response varies from partial non-response (failure to answer just one or some questions) to total non-response. Total non-response occurred because the interviewer was either unable to contact the respondent, no member of the household was able to provide the information, or the respondent refused to participate in the survey. Total non-response was handled by adjusting the weight of households who responded to the survey to compensate for those who did not respond.

In most cases, partial non-response to the survey occurred when the respondent did not understand or misinterpreted a question, refused to answer a question, could not recall the requested information, or could not provide proxy information.

Since it is an unavoidable fact that estimates from a sample survey are subject to sampling error, sound statistical practice calls for researchers to provide users with some indication of the magnitude of this sampling error. This section of the documentation outlines the measures of sampling error which Statistics Canada commonly uses and which it urges users producing estimates from this microdata file to use also.

The basis for measuring the potential size of sampling errors is the standard error of the estimates derived from survey results.

However, because of the large variety of estimates that can be produced from a survey, the standard error of an estimate is usually expressed relative to the estimate to which it pertains. This resulting measure, known as the coefficient of variation (C.V) of an estimate, is obtained by dividing the standard error of the estimate by the estimate itself and is expressed as a percentage of the estimate.

For example, suppose that, based upon the survey results, one estimates that 78% of Canadian volunteers did so in order to use their skills and experience and this estimate is found to have standard error of .03. Then the coefficient of variation of the estimate is calculated as :

$$\left( \frac{.03}{.78} \right) \times 100\% = 3.8\%$$

## 9 GUIDELINES FOR TABULATION, ANALYSIS AND RELEASE

This section of the documentation outlines the guidelines to be adhered to by users tabulating, analysing, publishing or otherwise releasing any data derived from the survey microdata tapes. With the aid of these guidelines, users of microdata should be able to produce the same figures as those produced by Statistics Canada and, at the same time, will be able to develop currently unpublished figures in a manner consistent with these established guidelines.

### 9.1 Rounding Guidelines

In order that estimates for publication or other release derived from these microdata tapes correspond to those produced by Statistics Canada, users are urged to adhere to the following guidelines regarding the rounding of such estimates:

- a) Estimates in the main body of a statistical table are to be rounded to the nearest hundred units using the normal rounding technique. In normal rounding, if the first or only digit to be dropped is 0 to 4, the last digit to be retained is not changed. If the first or only digit to be dropped is 5 to 9, the last digit to be retained is raised by one. For example, in normal rounding to the nearest 100, if the last two digits are between 00 and 49, they are changed to 00 and the preceding digit (the hundreds digit) is left unchanged. If the last digits are between 50 and 99 they are changed to 00 and the preceding digit is incremented by 1.
- b) Marginal sub-totals and totals in statistical tables are to be derived from their corresponding unrounded components and then are to be rounded themselves to the nearest 100 units using normal rounding.
- c) Averages, proportions, rates and percentages are to be computed from unrounded components (i.e. numerators and/or denominators) and then are to be rounded themselves to one decimal using normal rounding. In normal rounding to a single digit, if the final or only digit to be dropped is 0 to 4, the last digit to be retained is not changed. If the first or only digit to be dropped is 5 to 9, the last digit to be retained is increased by 1.
- d) Sums and differences of aggregates (or ratios) are to be derived from their corresponding unrounded components and then are to be rounded themselves to the nearest 100 units (or the nearest one decimal) using normal rounding.
- e) In instances where, due to technical or other limitations, a rounding technique other than normal rounding is used resulting in estimates to be published or otherwise released which differ from corresponding estimates published by Statistics Canada, users are urged to note the reason for such differences in the publication or release document(s).
- f) Under no circumstances are unrounded estimates to be published or otherwise released by users. Unrounded estimates imply greater precision than actually exists.

## **9.2 Sample Weighting Guidelines for Tabulation**

The sample design used for the National Survey of Giving, Volunteering and Participating was not self-weighting. When producing simple estimates, including the production of ordinary statistical tables, users must apply the proper sampling weight.

If proper weights are not used, the estimates derived from the microdata tapes cannot be considered to be representative of the survey population, and will not correspond to those produced by Statistics Canada.

Users should also note that some software packages may not allow the generation of estimates that exactly match those available from Statistics Canada, because of their treatment of the weight field.

### **9.2.1 Definitions of types of estimates: Categorical vs. Quantitative**

Before discussing how the National Survey of Giving, Volunteering and Participating data can be tabulated and analysed, it is useful to describe the two main types of point estimates of population characteristics which can be generated from the microdata file for the National Survey of Giving, Volunteering and Participating.

#### **Categorical Estimates**

Categorical estimates are estimates of the number, or percentage of the surveyed population possessing certain characteristics or falling into some defined category. The number of Canadians who volunteered or the number of Canadians who made financial donations are examples of such estimates. An estimate of the number of persons possessing a certain characteristic may also be referred to as an estimate of an aggregate.

#### **Examples of Categorical Questions :**

Q: In the past 12 months, did you provide information or help to educate, influence public opinion or lobby others on behalf of an organization:

R: Yes / No

Q: In the past 12 months, have you made a charitable donation by responding to a request through the mail?

R: Yes/ No

#### **Quantitative Estimates**

Quantitative estimates are estimates of totals or of means, medians and other measures of central tendency of quantities based upon some or all of the members of the surveyed population. They also specifically involve estimates of the form  $\bar{X}/\hat{Y}$  where  $\bar{X}$  is an estimate of surveyed population quantity total and  $\hat{Y}$  is an estimate of the number of persons in the surveyed population contributing to that total quantity.

An example of a quantitative estimate is the average hours volunteered by volunteers. The numerator is an estimate of the total number of hours volunteered, and its denominator is the number of persons who volunteered.

### Examples of Quantitative Questions :

Q: To the nearest hour, approximately how many hours did you volunteer for this organization?

R: |\_|\_| hours

Q: What was the amount of this donation?

R: |\_|\_|\_|\_| dollars

### **9.2.2 Tabulation of Categorical Estimates**

Estimates of the number of people with a certain characteristic can be obtained from the microdata file by summing the final weights of all records possessing the characteristic(s) of interest. Proportions and ratios of the form  $X/Y$  are obtained by:

- (a) summing the final weights of records having the characteristic of interest for the numerator (X),
- (b) summing the final weights of records having the characteristic of interest for the denominator (Y), then
- (c) dividing the numerator estimate by the denominator estimate.

### **9.2.3 Tabulation of Quantitative Estimates**

Estimates of quantities can be obtained from the microdata file by multiplying the value of the variable of interest by the final weight for each record, then summing this quantity over all records of interest. For example, to obtain an estimate of the total number of hours volunteered by those aged 65 and over, multiply the value reported in DVHRSTOT (hours volunteered) by the final weight for the record, then sum this value over all records with AGEGR=6 (age group 65 and over).

To obtain a weighted average of the form  $X/Y$ , the numerator (X) is calculated as for a quantitative estimate and the denominator (Y) is calculated as for a categorical estimate. For example, to estimate the average number of hours volunteered by those 65 years of age and older:

- (a) estimate the total number of hours volunteered as described above,
- (b) estimate the number of people in this category by summing the final weights of all records with AGEGR=6, then
- (c) divide estimate (a) by estimate (b).

### **9.3 Guidelines for Statistical Analysis**

The National Survey of Giving, Volunteering and Participating is based upon a complex design, with stratification and multiple stages of selection, and unequal probabilities of selection of respondents. Using data from such complex surveys presents problems to analysts because the survey design and the selection probabilities affect the estimation and variance calculation procedures that should be used.

While many analysis procedures found in statistical packages allow weights to be used, the meaning or definition of the weight in these procedures differ from that which is appropriate in a sample survey framework, with the result that while in many cases the estimates

produced by the packages are correct, the variances that are calculated are almost meaningless.

For many analysis techniques (for example linear regression, logistic regression, analysis of variance), a method exists which can make the application of standard packages more meaningful. If the weights on the records are rescaled so that the average weight is one (1), then the results produced by the standard packages will be more reasonable; they still will not take into account the stratification and clustering of the sample's design, but they will take into account the unequal probabilities of selection. The rescaling can be accomplished by dividing each weight by the overall average weight before the analysis is conducted.

In order to provide a means of assessing the quality of tabulated estimates, Statistics Canada has produced a set of Approximate Sampling Variability Tables (commonly referred to as "C.V. Tables") for the National Survey of Giving, Volunteering and Participating. These tables can be used to obtain approximate coefficients of variation for categorical-type estimates and proportions. See Chapter 10 for more details.

#### **9.4 C.V. Release Guidelines**

Before releasing and/or publishing any estimate from these microdata tapes, users should first determine the number of respondents who contribute to the calculation of the estimate. If this number is less than 30, the weighted estimate should not be released regardless of the value of the coefficient of variation for this estimate. For weighted estimates based on sample sizes of 30 or more, users should determine the coefficient of variation of the **rounded** estimate and follow the guidelines below.

### Sampling Variability Guidelines

Quality Level of Estimate	Guidelines
1. Acceptable	<p>Estimates have: a sample size of 30 or more, and low coefficients of variation in the range 0.0% - 16.5%</p> <p>No warning is required.</p>
2. Marginal	<p>Estimates have: a sample size of 30 or more, and high coefficients of variation in the range 16.6% - 33.3%.</p> <p>Estimates should be flagged with the letter M (or some similar identifier). They should be accompanied by a warning to caution subsequent users about the high levels of error, associated with the estimates.</p>
3. Unacceptable	<p>Estimates have: a sample size of less than 30, or very high coefficients of variation in excess of 33.3%.</p> <p>Statistics Canada recommends not to release estimates of unacceptable quality. However, if the user chooses to do so then estimates should be flagged with the letter U (or some similar identifier) and the following warning should accompany the estimates:</p> <p>"The user is advised that . . . (specify the data) . . . do not meet Statistics Canada's quality standards for this statistical program. Conclusions based on these data will be unreliable, and most likely invalid. These data and any consequent findings should not be published. If the user chooses to publish these data or findings, then this disclaimer must be published with the data."</p>

## 10 APPROXIMATE SAMPLING VARIABILITY TABLES

In order to supply coefficients of variation which would be applicable to a wide variety of categorical estimates produced from this microdata file and which could be readily accessed by the user, a set of Approximate Sampling Variability Tables has been produced. These "look-up" tables allow the user to obtain an approximate coefficient of variation based on the size of the estimate calculated from the survey data.

The coefficients of variation (C.V) are derived using the variance formula for simple random sampling and incorporating a factor which reflects the multi-stage, clustered nature of the sample design. This factor, known as the design effect, was determined by first calculating design effects for a wide range of characteristics and then choosing from among these a conservative value to be used in the look-up tables which would then apply to the entire set of characteristics.

The table below shows the design effects, sample sizes and population counts by province which were used to produce the Approximate Sampling Variability Tables.

PROVINCE	DESIGN EFFECT	SAMPLE SIZE	POPULATION
Newfoundland	1.87	691	448,455
Prince Edward Island	1.60	530	107,461
Nova Scotia	2.26	1,341	743,863
New Brunswick	1.72	1,122	603,826
Quebec	2.67	3,300	5,941,227
Ontario	2.60	5,475	9,032,481
Manitoba	2.10	1,402	861,362
Saskatchewan	1.87	1,367	761,824
Alberta	2.03	1489	2,182,293
British Columbia	2.30	1584	3,125,359
<b>Canada</b>	3.01	18301	23,808,151

All coefficients of variation in the Approximate Sampling Variability Tables are approximate and, therefore, unofficial. Estimates of actual variance for specific variables may be obtained from Statistics Canada on a cost-recovery basis. The use of actual variance estimates would allow users to release otherwise unreleaseable estimates, i.e. estimates with coefficients of variation in the 'confidential' range.

Remember: if the number of observations on which an estimate is based is less than 30, the weighted estimate should not be released regardless of the value of the coefficient of variation for this estimate. This is because the formulas used for estimating the variance do not hold true for small sample sizes.

## **10.1 How to use the C.V. tables for Categorical Estimates**

The following rules should enable the user to determine the approximate coefficients of variation from the Sampling Variability Tables for estimates of the number, proportion or percentage of the surveyed population possessing a certain characteristic and for ratios and differences between such estimates.

### **Rule 1: Estimates of Numbers Possessing a Characteristic (Aggregates)**

The coefficient of variation depends only on the size of the estimate itself. On the Sampling Variability Table for the appropriate geographic area, locate the estimated number in the left-most column of the table (headed "Numerator of Percentage") and follow the asterisks (if any) across to the first figure encountered. This figure is the approximate coefficient of variation.

### **Rule 2: Estimates of Proportions or Percentages Possessing a Characteristic**

The coefficient of variation of an estimated proportion or percentage depends on both the size of the proportion or percentage and the size of the total upon which the proportion or percentage is based. Estimated proportions or percentages are relatively more reliable than the corresponding estimates of the numerator of the proportion or percentage, when the proportion or percentage is based upon a sub-group of the population. For example, the proportion of volunteers is more reliable than the estimated number of volunteers. (Note that in the tables the cv's decline in value reading from left to right).

When the proportion or percentage is based upon the total population of the geographic area covered by the table, the cv of the proportion or percentage is the same as the cv of the numerator of the proportion or percentage. In this case, Rule 1 can be used.

When the proportion or percentage is based upon a subset of the total population (e.g. those in a particular sex or age group), reference should be made to the proportion or percentage (across the top of the table) and to the numerator of the proportion or percentage (down the left side of the table). The intersection of the appropriate row and column gives the coefficient of variation.

### **Rule 3: Estimates of Differences Between Aggregates or Percentages**

The standard error of a difference between two estimates is approximately equal to the square root of the sum of squares of each standard error considered separately. That is, the standard error of a difference ( $\hat{d} = \bar{X}_1 - \bar{X}_2$ ) is:

$$\sigma_{\hat{d}} = \sqrt{(\hat{X}_1 \alpha_1)^2 + (\hat{X}_2 \alpha_2)^2}$$

where  $\bar{X}_1$  is estimate 1,  $\bar{X}_2$  is estimate 2, and  $\alpha_1$  and  $\alpha_2$  are the coefficients of variation of  $\bar{X}_1$  and  $\bar{X}_2$  respectively. The coefficient of variation of  $\hat{d}$  is given by  $\sigma_{\hat{d}}/\hat{d}$ . This formula is accurate for the difference between separate and uncorrelated characteristics, but is only approximate otherwise.

#### Rule 4: Estimates of Ratios

In the case where the numerator is a subset of the denominator, the ratio should be converted to a percentage and Rule 2 applied. This would apply, for example, to the case where the denominator is the number of volunteers and the numerator is the number of volunteers who are employed.

In the case where the numerator is not a subset of the denominator, as for example, the ratio of the number of full-time paid workers who volunteered as compared to the number of part-time paid workers who volunteered in the reference year, the standard deviation of the ratio of the estimates is approximately equal to the square root of the sum of squares of each coefficient of variation considered separately multiplied by R. That is, the standard error of a ratio ( $R = X_1 / X_2$ ) is:

$$\sigma_{\hat{R}} = \hat{R} \sqrt{\alpha_1^2 + \alpha_2^2}$$

where  $\alpha_1$  and  $\alpha_2$  are the coefficients of variation of  $X_1$  and  $X_2$  respectively.

The coefficient of variation of R is given by  $\sigma_{\hat{R}}/R$ . The formula will tend to overstate the error, if  $X_1$  and  $X_2$  are positively correlated and understate the error if  $X_1$  and  $X_2$  are negatively correlated.

#### Rule 5: Estimates of Differences of Ratios

In this case, Rules 3 and 4 are combined. The cv's for the two ratios are first determined using Rule 4, and then the cv of their difference is found using Rule 3.

### 10.2 How to use the C.V. tables to obtain Confidence Limits

Although coefficients of variation are widely used, a more intuitively meaningful measure of sampling error is the confidence interval of an estimate. A confidence interval constitutes a statement on the level of confidence that the true value for the population lies within a specified range of values. For example a 95% confidence interval can be described as follows:

If sampling of the population is repeated indefinitely, each sample leading to a new confidence interval for an estimate, then in 95% of the samples the interval will cover the true population value.

Using the standard error of an estimate, confidence intervals for estimates may be obtained under the assumption that under repeated sampling of the population, the various estimates obtained for a population characteristic are normally distributed about the true population value. Under this assumption, the chances are about 68 out of 100 that the difference between a sample estimate and the true population value would be less than one standard error, about 95 out of 100 that the difference would be less than two standard errors, and about 99 out 100 that the differences would be less than three standard errors. These different degrees of confidence are referred to as the confidence levels.

Confidence intervals for an estimate,  $\hat{X}$ , are generally expressed as two numbers, one below the estimate and one above the estimate, as  $(\hat{X}-k, \hat{X}+k)$  where  $k$  is determined depending upon the level of confidence desired and the sampling error of the estimate.

Confidence intervals for an estimate can be calculated directly from the Approximate Sampling Variability Tables by first determining from the appropriate table the coefficient of variation of the estimate  $\hat{X}$ , and then using the following formula to convert to a confidence interval CI:

$$CI_X = [\hat{X} - t\hat{X}\alpha_{\hat{X}}, \hat{X} + t\hat{X}\alpha_{\hat{X}}]$$

where  $\alpha_{\hat{X}}$  is the determined coefficient of variation of  $\hat{X}$ , and

- t = 1 if a 68% confidence interval is desired
- t = 1.6 if a 90% confidence interval is desired
- t = 2 if a 95% confidence interval is desired
- t = 3 if a 99% confidence interval is desired.

Note: Release guidelines which apply to the estimate also apply to the confidence interval. For example, if the estimate is not releasable, then the confidence interval is not releasable either.

### **10.3 How to use the C.V. tables to do a t-test**

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The sample estimates can be numbers, averages, percentages, ratios, etc. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the characteristics are different when, in fact, they are identical.

Let  $X_1$  and  $X_2$  be sample estimates for 2 characteristics of interest. Let the standard error on the difference  $X_1 - X_2$  be  $\sigma_d$ .

If 
$$= \frac{\hat{X}_1 - \hat{X}_2}{\sigma_d}$$
 is between -2 and 2, then no conclusion about the difference between

the characteristics is justified at the 5% level of significance. If however, this ratio is smaller than -2 or larger than +2, the observed difference is significant at the 0.05 level. That is to say that the characteristics are significant.

### **10.4 Coefficients of Variation for Quantitative Estimates**

For quantitative estimates, special tables would have to be produced to determine their sampling error. Since most of the variables for the National Survey of Giving, Volunteering and Participating are primarily categorical in nature, this has not been done.

As a general rule, however, the coefficient of variation of a quantitative total will be larger than the coefficient of variation of the corresponding category estimate (i.e., the estimate of the number of persons contributing to the quantitative estimate). If the corresponding category estimate is not releasable, the quantitative estimate will not be either. Hence if the coefficient of variation of the proportion is not releasable, then the coefficient of variation of the corresponding quantitative estimate will also not be releasable.

Coefficients of variation of such estimates can be derived as required for a specific estimate using a technique known as pseudo replication. This involves dividing the records on the microdata files into subgroups (or replicates) and determining the variation in the estimate from replicate to replicate. Users wishing to derive coefficients of variation for quantitative estimates may contact Statistics Canada for advice on the allocation of records to appropriate replicates and the formulae to be used in these calculations.

**10.5 C.V. Tables**

Survey of Giving, Volunteering & Participating

Approximate Sampling Variability Tables for Newfoundland

NUMERATOR OF PERCENTAGE ('000)	ESTIMATED PERCENTAGE

## 11 WEIGHTING

Since the National Survey of Giving, Volunteering and Participating used a sub-sample of the LFS sample, the derivation of weights for the survey records is clearly tied to the weighting procedure used for the LFS. The LFS weighting procedure is briefly described below.

### 11.1 Weighting Procedures for the LFS

In the LFS, the final weight attached to each record is the product of the following factors: the basic weight, the cluster sub-weight, the balancing factor for non-response, the rural-urban factor and the province-age-sex ratio adjustment factor. Each is described below.

#### Basic Weight

In a probability sample, the sample design itself determines weights which must be used to produce unbiased estimates of the population. Each record must be weighted by the inverse of the probability of selecting the person to whom the record refers. In the example of a 2% simple random sample, this probability would be .02 for each person and the records must be weighted by  $1/.02=50$ . Because all eligible individuals in a dwelling are interviewed (directly or by proxy), this probability is essentially the same as the probability with which the dwelling is selected.

#### Cluster Sub-weight

The cluster delineation is such that the number of dwellings in the sample increases very slightly with moderate growth in the housing stock. Substantial growth can be tolerated in an isolated cluster before the additional sample represents a field collection problem. However, if growth takes place in more than one cluster in an interviewer assignment, the cumulative effect of all increases may create a workload problem. In clusters where substantial growth has taken place, sub-sampling is used as a means of keeping interviewer assignments manageable. The cluster sub-weight represents the inverse of this sub-sampling ratio in clusters where sub-sampling has occurred.

#### Non-response

Notwithstanding the strict controls of the LFS, some non-response is inevitable, despite all the attempts made by the interviewers. The LFS non-response rate is approximately 5%. For certain types of non-response (eg. household temporarily absent, refusal), data from a previous month's interview with the household if any, is brought forward and used as the current month's data for the household.

In other cases, non-response is compensated for by proportionally increasing the weights of responding households. The weight of each responding record is increased by the ratio of the number of households that should have been interviewed, divided by the number that were actually interviewed. This adjustment is done separately for geographic areas called balancing units. It is based on the assumption that the households that have been interviewed represent the characteristics of those that should have been interviewed. To the extent that this assumption is not true, the estimates will be somewhat biased.

### Rural-urban Factor

In NSRUs without sufficient rural and urban population for explicit urban and rural strata to be formed, each primary sampling unit (PSU) is composed of both urban and rural parts. Information concerning the total population in rural and urban areas is available from the 1981 Census for each PSU as well as for each economic region (ER) in which explicit urban/rural stratification is not done. Comparison by ER with the actual 1981 rural or urban census counts indicates whether the selected PSUs over- or under-represent the respective areas. The ratio of actual rural-urban counts is divided by the corresponding estimates. These two factors are computed for each relevant ER at the time of selection of the PSUs and are entered on each sample record according to the appropriate area (rural or urban) of the NSRU. Changes in these factors are incorporated at the time of PSU rotations.

### LFS Sub-Weight

The product of the previously described weighting factors is called the LFS sub-weight. All members of the same sampled dwelling have the same sub-weight.

### Subprovincial and Province-Age-Sex Adjustments

The sub-weight can be used to derive a valid estimate of any characteristic for which information is collected by the LFS. In particular, estimates are produced of the total number of persons 15+ in provincial economic regions and the 24 large metropolitan areas as well as of designated age-sex groups in each of the ten provinces.

Independent estimates are available monthly for various age and sex groups by province. These are population projections based on the most recent Census data, records of births and deaths, and estimates of migration. In the final step, this auxiliary information is used to transform the sub-weight into the final weight. This is done using a linear regression model. The regression is set up to ensure that the final weights it produces sum to the census projections for the auxiliary variables, namely various age-sex groups, economic regions and census metropolitan areas.

This weighting procedure ensures consistency with external Census counts, and also ensures that every member of the economic family is assigned the same weight.

## **11.2 Weighting Procedures for the National Survey of Giving, Volunteering and Participating**

The principles behind the calculation of the weights for the National Survey of Giving, Volunteering and Participating are identical to those for the LFS. However, further adjustments are made to the LFS weights in order to derive a final weight for the individual records on the National Survey of Giving, Volunteering and Participating microdata file.

- (1) An adjustment to account for the use of a 5/6 sub-sample, instead of the full LFS sample.
- (2) An adjustment to account for the additional non-response to the supplementary survey i.e., non-response to the National Survey of Giving, Volunteering and Participating for individuals who did respond to the LFS or for which previous month's LFS data was brought forward.

- (3) An adjustment to account for the random selection of one respondent from the selected household
- (4) An adjustment to account for the sub-sample of non-volunteer records
- (5) A readjustment to account for independent province-sex-age group and economic region (ER) and census metropolitan area (CMA) projections (poststratification) after the above adjustments are made.
- (6) A readjustment to account for independent province-age-sex projections, after the above adjustments are made.
- (7) A readjustment to account for independent economic region - census metropolitan area projections, after the above adjustments are made.

## **12. STRUCTURE OF THE NSGVP FILES**

There are three data files for the NSGVP. The main answer file (SGVP.TXT), the volunteer event file (VOLNTR.TXT) and the GIVE file (GIVE.TXT). To link between files use the variable IDNUM.

### **12.1 SGVP.TXT**

This is the main answer file and contains one record per respondent. All questions except for those on the VOLNTR and GIVE files are located here. In addition, summary derived variables from the VOLNTR and GIVE have been created on the SGVP file.

### **12.2. VOLNTR.TXT**

This is the volunteer organization answer file. It will contain 0-3 records per person who volunteered (1 per organization the respondent volunteered with). This file contains information on the type of organization for which the individual volunteered, and the number of hours volunteered for the organization. Summary variables from this file have been derived and are located on the SGVP file. Use the variable IDNUM to link with other files.

### **12.3 GIVE.TXT**

This is the charitable donation answer file. It will contain 0-n records per person who made a charitable donation. Each record represents 1 donation made to a charitable organization. For each donation made, this file contains information on the type of organization to whom the donation was made as well as the value of the donation. Summary variables from this file have been derived and are located on the SGVP file. Use the variable IDNUM to link with other files.
