

SPSD/M

Parameter Guide

This guide contains an encyclopaedic reference to SPSD/M parameters. An overview of parameters and a description of each of the three kinds of parameters (control, adjustment, and tax/transfer) is given.

January 23, 2001

Introduction

The Social Policy Simulation Model may be customized in two ways. The first is to modify the actual "C++" language source code. This requires knowledge of the programming language as well as knowledge about the actual structure and implementation of the model.

A far simpler but less flexible and less powerful means of changing the function of the model is to turn the knobs and flip the switches provided by the model designers. These knobs and switches are known as parameters.

The purpose of this document is to provide an explanation of all parameters provided with the model. This introduction provides an overview of the parameter files and types of parameters which control the model, methods available for their examination and the source of the individual parameter's values.

Section 2, organized by program, provides an overview of the parameters. For example, all parameters related to calculating Social Assistance (SAFLAG, SAELDOPT, SAFS, SFAOUT, and IMPSAOPT) are listed together and each has a one line description.

In Section 3, the parameters are described in fuller detail. The alphabetic organization of this section will allow the user to locate a specific parameter more easily. References to the program function are given in this section to provide a cross reference to the *Algorithm Guide*.

Parameter Files

The files containing the parameter values have names which are given the extensions ".cpr" (control parameters), ".apr" (database adjustment parameters), and ".mpr" (tax/transfer model parameters). The values assigned may be changed by editing these files; interactively, during the running of the model; or by external models which generate these parameter files as output. Users should consult the SPSD/M User's Guide for a full description of modifying parameter values. The parameters in the commodity tax section of the model are generated by an external Input/Output model and should be altered only through that model. See the COMTAX User's Guide for more details.

The SPSM is designed to provide a great deal of flexibility through changing parameter values. Parameters are used for controlling the function of the model, its reporting facilities, adjusting the data and to provide values and options for the tax/transfer simulations.

As distributed, the standard model algorithm uses over 850 parameters which are provided with default values for eighteen alternative variants, or distinct simulations:

1984 actual tax/transfer parameter values, projected database

1985 actual tax/transfer parameter values, projected database

1986 actual tax/transfer parameter values, projected database

1987 actual tax/transfer parameter values, projected database

1988 actual tax/transfer parameter values, projected database 1989 actual tax/transfer parameter values, projected database 1990 actual tax/transfer parameter values, projected database 1991 actual tax/transfer parameter values, projected database 1992 actual tax/transfer parameter values, projected database 1993 actual tax/transfer parameter values, projected database 1994 actual tax/transfer parameter values, projected database 1995 actual tax/transfer parameter values, projected database 1996 actual tax/transfer parameter values, 1996 database 1997 actual tax/transfer parameter values, projected database 1998 actual tax/transfer parameter values, projected database 1999 actual tax/transfer parameter values, projected database 2000 projected tax/transfer parameter values, projected database 2001 projected tax/transfer parameter values, projected database 2002 projected tax/transfer parameter values, projected database 2003 projected tax/transfer parameter values, projected database 2004 projected tax/transfer parameter values, projected database 2005 projected tax/transfer parameter values, projected database

Each of these variants is defined by a set of parameter files, as described above. For example, the 1988 variant is specified in the parameter files: ba88.cpr, ba88.mpr and ba96_88.apr.

The database adjustment parameters supplied with the full SPSD/M are based on differences between SPSD per capita base year (1996) figures and per capita national accounts data for available years. This method is also used for projected the value of tax/transfer parameters where necessary.

The following is a list of the parameter files included with the release of SPSD/M version 8.1. These files supercede all parameter files included with the version 8.0 release.

CONTROL ADJUSTMENT TAX/TRANSFER

The numeric portion of the file names refers to the calendar year which will be simulated.

BA05T.CPR

Within these files, the SPSM uses several types of parameters. Different types are checked for validity using different rules. The following is a description of the parameter types currently defined:

FLAG A flag controls whether or not an algorithm (or program or calculation) is

performed. With a value of one the algorithm is executed, with a value of zero it is not. Flag parameters always have the word "FLAG" as the last four letters in

their name.

A flag must take the value 0 or 1.

OPTION An option parameter allows the choice of two or more algorithms (or programs

or calculations). Values range from 1 to the number of options allowed. Option

parameters always end in "OPT".

A valid option value is an integer between 1 and the highest number allowed in

the parameter definition.

SCALAR Scalar parameters take a single numeric value with or without a decimal point.

STRING A string parameter is a short single line of text.

VECTOR A vector is a single column of numbers. The first value is the number of values

to follow. The program checks that the correct number of values are included.

LOOKUP A lookup table contains a single value followed by a set of three columns. The initial single value indicates the number of rows which are to follow. The tables

initial single value indicates the number of rows which are to follow. The tables are used in a similar manner as a tax table. A value, such as taxable income, is provided as a parameter to a look up program and the amount of tax payable is returned. In a lookup table, the first column represents the input value, such as taxable income. The second column represents the output value corresponding to the input value in the same column. The third column represents the marginal

change in the output value for the next increment (or tax bracket).

TABLE A table is a numeric array with an arbitrary number or rows and columns. The

array is preceded by a number indicating the number of rows to follow.

Users should note that some parameters have been estimated and the user is encouraged to inform us of the existence of more refined estimates or more appropriate values.

Examining Parameter Values

To review the values of the parameters for each variant, users may consult two sources. The actual parameter files included with the model are the primary source and are the definitive source to be consulted. In addition, as part of the online help guide, the SPSD/M Parameter Guide contains all the default values for the parameters.

Two tools have been provided to assist you in reviewing the parameter files directly:

compparm: This utility will compare any two parameter files and produce a report detailing their differences. Please refer to the SPSD/M Tool User's Guide for a detailed description of its use.

grep: This utility searches all specified files for a given string and displays lines in which the string is found. This allows for the comparison of the values of specific parameters across

multiple parameter files. Please refer to the SPSD/M Tool User's Guide for a detailed description of its use.

Users may also use a text editor to actually scan the parameter files directly. This method allows one to review all associated comments in context. Glass box users, and others, may wish to take this one step further and review the use of the parameters of interest in the C++ language source code provided with the model. For a detailed discussion of working with parameters and the parameter files please see the *SPSD/M User's Guide*.

Source of Parameter Values

The values used in the model have been drawn from a number of official publications associated with the tax/transfer system. For individual parameters, parameter values and sources organized by parameter may be found in the online parameter guide.

Parameter Guide Page 6 Version 8.1

1 Parameter by Program

1.1 Model Control Parameters

1.1.1 General Information

CPRDESC Description of SPSM run [string]

LICENSEE SPSD/M licensee [string]

AUTHOR Name of person doing simulation [string]
OUTCPR Name of control parameter file (out) [string]
ALGDESC Names of standard and alternate algorithms

BRKFLAG Activate interception of `Break' key

BEEPFLAG Beep on completion

CLOSEFLAG Close window on completion

UPDATEINT Interval between screen updates (hhlds) ETAFLAG Activate fraction completed display

ROUNDFLAG Round disposable and consumable income

LOGFLAG Produce a .log file for this run
OUTLOG Name of log file (out) [string]

1.1.2 SPSD Input Files

INPSPD Name of SPSD file (in) [string]

FXVFLAG Read FAMEX expenditure vector file INPFXV Name of FAMEX vector file (in) [string]

WGTFLAG Read weight file

INPWGT Name of weight file (in) [string]

REFFLAG Read reference results file

INPREF Name of reference results file (in) [string]
REFVARS Reference results file variables [string]

1.1.3 Database Adjustment

AGENAME Name of database adjustment algorithm [string] INPAPR Name of database adjustment parameter file (in)

[string]

OUTAPR Name of database adjustment parameter file (out)

[string]

1.1.4 Variant Information

VARALG Name of variant algorithm [string]
VARMETH Method of creating variant variables
VARDESC Description of variant parameters [string]
INPVARMPR Name of variant tax/transfer parameter file (in)

[string]

OUTVARMPR Name of variant tax/transfer parameter file (out)

[string]

OUTMRSFLAG Variant results file creation flag

OUTVARMRS Name of variant results file (out) [string]
OUTMRSVARS Variant results file variables [string]

OUTMRSFRAC Variant results file preserves fractional part

1.1.5 Base Information

BASALG Name of base algorithm [string]
BASMETH Method of creating base variables
BASDESC Description of base parameters [stri

BASDESC Description of base parameters [string]
INPBASMPR Name of base tax/transfer parameter file (in)

[string]

INPBASMRS Name of base results file (in) [string]
INPMRSVARS Base results file variables [string]

1.1.6 Subsampling, Random Number Seed

SAMPLEREQ Size of sample requested SAMPLE Size of sample obtained WGTTOT Sum of weights on tax file

SEED Random number generator seeds

1.1.7 Record Selection Facility

SELFLAG Selection facility activation flag SELUNIT Selection facility family level SELSPEC Selection specification [string]

SELMAX Selection facility maximum # of households

1.1.8 Marginal Tax Rate Facility

MARFLAG Marginal tax rate facility activation flag
MARAMT Amount to be added to variable for marginal

calculation

MARVAR Variable to add MARAMT to [string]
MARSPEC Expression identifying recipients [string]
MARBASEFLAG Save marginal results as base run flag

1.1.9 Turning Point Facility

TPFLAG Turning point facility activation flag

TPSPEC Expression identifying individuals to change

[string]

TPVARS Variables to modify [string]

TPMETH Method for modifying variables [1=additive,

2=multiplicative]

TPLL Lower limit for modified variables
TPUL Upper limit for modified variables

1.1.10 User-defined Variables

UVARFLAG Activate UVAR parameter for expressions

UVAR User statements [string]

1.1.11 Text Output Facility

ASCFLAG Text output facility activation flag
OUTASC Name of text output file (out) [string]

ASCUNIT Text output family level
ASCSTYLE Style of text output
ASCDELIM Field delimiter

ASCEXTPRC Number of digits of extra precision
ASCVARS Variables selected for text output [string]

1.1.12 SAS Output Facility

SASFLAG SAS output facility activation flag
OUTSAS Name of SAS output file (out) [string]

SASUNIT SAS output family level

SASVARS Variables selected for SAS output [string]

SASTITLE SAS file label [string]

1.1.13 Reports

OUTTBL Name of report file (out) [string]

1.1.14 Parameter Reporting

PRDFFLAG Parameter difference report activation flag

1.1.15 Tabular Reporting

1.1.15.1 Built-in Tables

T0FLAG Canada totals table flag (Dollars) Canada totals table flag (Units) T0AFLAG T1FLAG Provincial totals table flag (Dollars) T1AFLAG Provincial totals table flag (Units) Income group totals table flag (Dollars) T2FLAG T2AFLAG Income group totals table flag (Units) T3FLAG Family type totals table flag (Dollars) T3AFLAG Family type totals table flag (Units)

T4FLAG LICO ratio group totals table flag (Dollars)
T4AFLAG LICO ratio group totals table flag (Units)

TABUNIT Built-in tables family level

TABDELTA Built-in tables winner/loser threshold INCVAR Variable to use for table 2 [string] INCGP Income cutpoints for table 2 [array]

PVRAT Family poverty ratio fractions for table 4 [array]

1.1.15.2 User-specified Tabulation Facility

XTFLAG X-tab facility activation flag XTSPEC X-tab specification [string]

XTDBLFLAG X-tab double precision activation flag

XTCOLS X-tab desired print width XTLINES X-tab desired lines per page

1.1.15.3 Distributional Analysis Facility

DISTFLAG Distribution facility activation flag
DISTUNIT Distribution facility family level
DISTVAR Distribution facility variable [string]
DISTSAMP Distribution facility sample size

DISTZERO Distribution facility zero inclusion flag
DISTP Breakpoints for histogram plot [array]

DISTPWID Width of histogram plot DISTPHGT Height of histogram plot

INEQFLAG Inequality measures facility activation flag INEQMEASURE Type of inequality measure [social preference,

center of weight distribution]

1.2 Database Adjustment Parameters

1.2.1 File Description Parameters

APRDESC Description of database adjustment parameter file

1.2.2 Structural Parameters

1.2.2.1 Provincial Mapping

PROVMAP Provincial remapping [prov]

1.2.2.2 Imputation Method

IMPUIBOPT Imputation method, UI [1=none 2=rank]
IMPSAOPT Imputation method, SA [1=none 2=rank]
IMPCQPOPT Imputation method, CQP [1=none 2=rank]

IMPINTOPT Imputation method, Interest [1=none 2=imputed]

1.2.2.3 Calculation Options

DNINCFLAG Disable no income flag for calculation

1.2.2.4 FAMEX Adjustments

CTTXRM Base year commodity tax removal factor [com x

prov]

CTCFALC FAMEX reporting error adjustment: Alcohol

[prov]

CTCFTOB FAMEX reporting error adjustment: Tobacco

[prov]

CTCFGAS FAMEX reporting error adjustment: Gasoline

[prov]

CTFAMSNA FAMEX->SNA conceptual conversion factor

[com]

KEEPNEGEXP Retain negative expenditures in FAMEX

1.2.2.5 Classification Variable Parameters

EARNMIN Earnings threshold to be an earner

1.2.2.6 Low Income Cut-off Parameters

PTF Low income cut-off [size, urban]

PVRAT Family poverty ratio fractions for table 4 [array]

1.2.2.7 RRSP Adjustment Parameters

RRSPIFLAG RRSP increment activation flag

RRSPEMIN Minimum (rpp+rrsp) for increment if rpp>0
RRSPEMAX Maximum (rpp+rrsp) for increment if rpp>0
RRSPEINC Increment to rrsp if conditions & rpp>0
RRSPSMIN Minimum (rrsp) for increment if rpp=0
RRSPSMAX Maximum (rrsp) for increment if rpp=0
RRSPSINC Increment to rrsp if conditions & rpp=0

1.2.3 Database Adjustment Factors

1.2.3.1 UI Growth Parameters

UIBASEYRMAX Maximum insurable earnings for base year UITARGYRMAX Maximum insurable earnings for target year

PURB Base year unemployment rate [prov]
PURC Current year unemployment rate [prov]

PURR Ratio current:base unemployment rate [prov]

1.2.3.2 Income, Expenditure and Deduction Items

All dollar denominated variables from the SCF, FAMEX and Greenbook have a corresponding growth parameter. The database value is always scaled by the corresponding parameter value. Minimally, all these parameters are vectors by province. In some cases parameters will have an extra

dimension (i.e.GFIEMP is grown by province and sex).

1.2.3.2.1	Market Income
1.4.3.4.1	Mai Net income

GFIEMP Growth Factor: Employment income

[province, sex]

IEMPADJ Adjustment Factor: Employment income

[employment income breaks,province]

IEMPBRK Adjustment Factor: Income breaks for income

adjustment[employment income breaks]

GFISEFM Growth Factor: Self-employed income - farming
GFISENF Growth Factor: Self-employed income - non-

farming

GFICAPG Growth Factor: Capital gains (actual) (127 * 1.5)
GFIDIV Growth Factor: Dividend income (actual) (120 /

1.5)

GFIINT Growth Factor: Interest income (121)

GFILOSS Growth Factor: Business investment losses (217)
GFIOINV Growth Factor: Other investment income with net

rental

GFIPENS Growth Factor: Pension income (115)
GFIALIMO Growth Factor: Alimony Income

GFITRRSP Growth Factor: Taxable RRSP withdrawls
GFITOTH Growth Factor: Other non-government income

(taxable)

GFINOTH Growth Factor: Other money income (non-

taxable)

1.2.3.2.2 Government Income

GFISA Growth Factor: Social assistance income
GFSAPRED Growth Factor: Predicted benefits from Social

Assistance

GFIVETP Growth Factor: Veterans Pensions
GFIWORKC Growth Factor: Worker's compensation
GFITOGV Growth Factor: Other government income

(taxable)

GFINOGV Growth Factor: Other government income (non-

taxable)

GFCPPL65 Growth Factor: CPP for age < 65 GFCPP65 Growth Factor: CPP for age 65 GFCPP66 Growth Factor: CPP for age 66 Growth Factor: CPP for age 67 GFCPP67 GFCPP68 Growth Factor: CPP for age 68 Growth Factor: CPP for age 69 GFCPP69 GFCPP70 Growth Factor: CPP for age 70 Growth Factor: CPP for age 71 GFCPP71 Growth Factor: CPP for age 72 GFCPP72 GFCPP73 Growth Factor: CPP for age 73 GFCPP74 Growth Factor: CPP for age 74

GFCPP75 Growth Factor: CPP for age 75 GFCPPG75 Growth Factor: CPP for age > 75

1.2.3.2.3 Deductions

GFADDDED Growth Factor: Additional deductions from net

income (256)

GFALEXP Growth Factor: Other allowable employment

expenses (229)

GFCAPGEX Growth Factor: Capital gains exemptions (254)

GFCARRY Growth Factor: Carrying charges (221)

GFCCET Growth Factor: Child care expenses associated

with child

GFCCETT Growth Factor: Child care expenses (Limit A,

Form T778)

GFCHARIT Growth Factor: Charitable donations (340)

GFCLOSS Growth Factor: Allowable other years capital loss

(253)

GFDALIMO Growth Factor: Alimony paid (220)

GFDISOTH Growth Factor: Disability amount for dependants

(318)

GFDISSLF Growth Factor: Disability amount for self (316)
GFDUES Growth Factor: Union and professional dues

(212)

GFEMPLO Growth Factor: Employee home relocation loan

dedn (248)

GFEXPLOR Growth Factor: Exploration and development

expenses (224)

GFFDSFT Growth Factor: Foreign tax credit applied to

surtax (511)

GFFORAVG Growth Factor: Forward averaging amount

withdrawal (237)

GFFORINC Growth Factor: Net foreign income (508)
GFFORTX Growth Factor: Foreign tax paid (507)

GFGIFTS Growth Factor: Gifts to Canada/provinces/culture

(342)

GFGSTREB Growth Factor: GST rebate (457)

GFHOMSTU Growth Factor: College residence/resident

homeowner assistance (558)

GFHOSSLF Growth Factor: Ontario HOSP contributions - self

(598)

GFHOSSPO Growth Factor: Ontario HOSP contributions -

spouse (599)

GFMEDGRO Growth Factor: Medical expenses, gross (330)
GFMINCAR Growth Factor: Minimum tax carryover (504)
GFMOVEXP Growth Factor: Imputed moving expenses (219)
GFMSCHPD Growth Factor: Manitoba school taxes paid

GFNCLOS Growth Factor: Allowable other years non-capital

loss (252)

GFNORTH Growth Factor: Northern deductions (255)
GFOTHDED Growth Factor: Other deductions from total

income (232)

GFOTHPE Growth Factor: Other dependant exemptions

(305)

GFPARTLO Growth Factor: Limited partnership losses (251)
GFPOLCON Growth Factor: Federal political contributions

(409)

GFPROPTX Growth Factor: Net property taxes paid (556)
GFPRVPOL Growth Factor: Provincial political contributions

(565)

GFRENTPD Growth Factor: Total rental payments (555)
GFRPP Growth Factor: Registered pension plan

contributions (207)

GFRRSP Growth Factor: RRSP contributions (208)
GFSTKDED Growth Factor: Stock option deduction (249)

GFTUITN Growth Factor: Tuition fees (320)

1.2.3.2.4 Tax Credits

GFITC Growth Factor: Federal investment tax credits

(412)

GFLABTXG Growth Factor: Labour funds tax credit (414)
GFPRVFTC Growth Factor: Provincial foreign tax credit

(Form T2036)

GFVENCAP Growth Factor: Venture capital tax credit (564)

1.2.3.2.5 Family Expenditure Items

GFFMX Adjustment Factor: consumer expenditure

categories [commodity]

GFRECOM Adjustment Factor: Real estate commissions
GFINTPL Adjustment Factor: Interest on personal loans
GFIPAC Adjustment Factor: Life insurance premiums and

annuity contributions

GFGVPEN Adjustment Factor: Government pension plan

contributions

GFPVPEN Adjustment Factor: Private pension plan

contributions

GFCQP Adjustment Factor: CPP/QPP contributions

GFUIC Adjustment Factor: UI contributions
GFINTAX Adjustment Factor: Income taxes
GFPRTAX Adjustment Factor: Property tax

GFTPTAX Adjustment Factor: Transfer of property taxes
GFRFEES Adjustment Factor: Registration and license fees

GFNES Adjustment Factor: Not elsewhere stated GFNCAL Adjustment Factor: Net change in assets and

liabilities

GFRRSPT Adjustment Factor: Total RRSP contributions

(FAMEX)

GFFABD Adjustment Factor: Account balancing difference

GFFOMR Adjustment Factor: Other money receipts
GFMORTI Adjustment Factor: Mortgage interest paid
GFHMKT Adjustment Factor: Market value of home

GFHMORT Adjustment Factor: Mortgage value outstanding

1.2.3.2.6 Employment Income Adjustment

IEMPADJ Adjustment Factor: Employment income

[employment income breaks,province]

IEMPBRK Adjustment Factor: Income breaks for income

adjustment[employment income breaks]

1.2.3.2.7 SCF Variables

GFSCFCTC Growth Factor: Child tax credit

GFSCFCQP Growth Factor: SCF CPP

GFSCFFTC Growth Factor: Federal tax credit
GFSCFINT Growth Factor: SCF interest income
GFSCFOAS Growth Factor: Old age security

GFSCFPTC Growth Factor: SCF provincial tax credits
GFSCFSA Growth Factor: SCF social assistance
GFSCFUIB Growth Factor: Unemployment insurance

benefits

GFUIPRED Growth Factor: Predicted benefits from UI

1.3 Government Transfers and Personal Income Taxes

1.3.1 Parameter File Description

MPRDESC Description of tax/transfer parameter file

TARGETYEAR Year of analysis

1.3.2 Database Variable Activation

A number of deductions and tax credits are imputed from the Geenbook. Only those deductions and tax credits included on the tax forms for the year of the database can be imputed. These parameters are used to 'turn off' certain programs in years for which they do not apply. Even when these parameters are set to zero, the variables to which they apply will contain values but those values will not affect consummable income.

DESCRIPTION

When Alberta tax on taxable income is calculated (ATXFLG = 1), there are three options as to how to calculate the provincial minimum tax.

When AAMTOPT is set to 1, then no provincial alternative minimum tax is calculated.

When AAMTOPT is set to 2, then a percentage (AAMTPCTF) of the additional federal tax due to the minimum tax is added to the basic provincial tax (imbpt).

When AAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the AAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

ACGTC Alta Caregiver Tax Credit

DESCRIPTION

ACGTC multiplied by APNTCR is the maximum amount of the Alberta Caregiver Tax Credit (impcgtc). The parameter is only used when the provincial tax on taxable income is calculated (ATXFLG = 1).

For more explanation see ACGTCFLG.

ACGTCFLG Alta Caregiver Tax Credit activation flag

DESCRIPTION

The calculation of the Alberta Caregiver Tax Credit (impcgtc) is activated by the flag ACGTCFLG.

The Caregiver Tax Credit (impcgtc) provides additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is ACGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate ACGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate ACGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, impcgtc, is reduced for each dollar of net income, iminet, in excess of ACGTCTD.

This non-refundable tax credit is only calculated when the provincial tax on taxable income

is calculated (ATXFLG = 1).

DESCRIPTION

This is the first take-up rate used in the calculation of Alberta's impogtc. It selects an individual with idefrh = 3 and assign him/her as a parent according to observed probability in SCF. The probability is also based on idage.

The parameter is only used when the provincial tax on taxable income is calculated (ATXFLG=1).

ADDDEDFLAG Database variable(addded) activation flag

DESCRIPTION

When this parameter is set to 1, the imputed variable for the additional deductions from net income (idaddded) is included in the calculation of Deductions From Net Income (imdedfn). With a value of zero the variable is not used.

AFETCNC	Δlherta I	Gamily Employment Tay Credit Maximum Number of Children

AFETCNC Alberta Family Employment Tax Credit Maximum Number of Children

DESCRIPTION

The maximum number of children in a family for whom the basic Alberta Employment Tax Credit benefit amount (AFETCBPC) may be claimed. The maximum family benefit is determined by multiplying the basic benefit amount (AFETCBPC) times the number of children in the nuclear family to a maximum of AFETCNC.

AGENAME Name of database adjustment algorithm [string]

DESCRIPTION

This control parameter describes the method and algorithms by which the database will be adjusted. The algorithm is always "standard adjustment" unless the algorithm is changed by the user in glass box mode. The AGENAME parameter cannot be changed by the user in black box mode. Its value is associated with the adjustment algorithm contained in the adj function. If a descriptive label for the complete set of adjustment parameters is required use APRDESC.

ALEXDEDFLG Other employment expenses deducted after total income calculation

DESCRIPTION

When this flag is turned on, other employment expenses (imalexp) are included in the

deductions from total income (imdedft) and are therefore deducted in the calculation of net income (iminet). When it is turned off, they are deducted in the calculation of total income (imitot).

ALEXPP Proportion of other allowable employment expenses to use as deduction

DESCRIPTION

The standard algorithm allows the imputed value for Other Allowable Employment Expenses to be reduced or grown using this factor. This may be used to simulate an increase or decrease in the amounts allowed for these expenses.

APRDESC Description of database adjustment parameter file

DESCRIPTION

This database adjustment parameter can be used to provide a description of a particular set of database adjustment parameters found in a given database adjustment parameter file. This descriptive text is reproduced in the page headers of any requested output reports.

APTC

Alberta political contribution table [total donations,donation allowed]

DESCRIPTION

This table contains the figures necessary to calculate the Alberta Political Contribution Tax Credit. The first column represents the dollar amount of total Alberta political contributions to which the corresponding percentages of the third column are applied to calculate the total Allowable Alberta Political Contribution Tax Credit. Only the first and third columns of the table need to be specified.

This table represents the Alberta tax curve used when calculating the tax on taxable income (ATXFLG=1). The first column represents Taxable Income, the second represents the amount of Basic Provincial Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

ASBBASIC Alberta seniors benefit annual basic benefit

DESCRIPTION

This parameter represents the basic annual benefit of Alberta's seniors for the years in which the Alberta Seniors Benefit system is active. This transfer payment scheme replaced the earlier Alberta Assured Income Plan. The resulting modelled benefit to Alberta seniors is stored in the imiasb variable.

ASBNOAS	Alberta seniors	benefit reduction if no OAS [senior type]

DESCRIPTION

This parameter represents the proportion of total Alberta Seniors Benefit which a person who is not eligible for OAS is entitled to receive. It is an array parameter and depends on the tenure and marital status. The order is as follows:

0 = single senior who is renting

- 1 =single senior who owns a home
- 2 = senior married to a non senior who is renting
- 3 = senior married to a non senior who owns a home
- 4 = married senior couple who rent
- 5 = married senior couple who owns their home

ASBSSOPT Alberta seniors benefit 1 senior couple option [1=model separately,2=model as senior couples]

DESCRIPTION

When this parameter is equal to 1, seniors who are married to non-seniors are treated separately in the Alberta Seniors Benefit program. When it is equal to 2, these seniors are treated in the same manner as a two senior couple.

ASCDELIM Field delimiter

DESCRIPTION

As noted in the description of the ASCSTYLE parameter, setting ASCSTYLE to 3 or 4 produces a database-style output file. ASCDELIM allows the user to control the delimiter used to separate variable values when these styles of output are used. If ASCDELIM is empty, a space is used as the delimiter. If any other character is used (such as a comma), that character is used as the delimiter. As a special case, the string consisting of the three letters TAB will use a tab character as the output delimiter.

ASCEXTPRC Number of digits of extra precision

DESCRIPTION

If ASCEXTPRC is left at zero, the text file output facility will operate as described in the <u>User's Guide</u>. Otherwise, ASCEXTPRC extra digits of precision will be used when outputting variables using the facility. This extra precision is useful to accurately compute marginal tax rates when using the turning point facility.

This control parameter flag, when set to a value of 1, enables the text file output facility. When enabled, a file with the file name extension ".prn" will be written using ASCSTYLE format for ASCUNIT level of analysis and ASCVARS variables. The text file output facility provides a method for examining detailed SPSD/M microdata.

ASCI Alberta surtax cut-in

DESCRIPTION

In Alberta, provincial surtax (impsur) is calculated as ASF percent of provincial taxes above the level ASCI plus AFTAX percent of taxable income (imitax).

ASCSTYLE Style of text output

DESCRIPTION

When enabled by ASCFLAG, this control parameter controls the formatting of the resulting text file output report. Users should refer to the <u>User's Guide</u> for a detailed explanation of the text output facility that this parameter controls. Five different styles of report can be produced, as given below.

- 1. Each household is output as a group of output lines, one household per page and one variable is output per line. Both the variable's name and label are printed and values for each unit are shown in aligned columns.
- 2. Produces a report designed to be read using a spreadsheet import function. The layout is

very similar to that for an style of 1, but variable labels and all superfluous spaces have been eliminated, and the printer page break character has been replace by and empty literal string.

- 3. Produces a report designed to read by a spreadsheet or database system. Each unit is recorded on a single line, with a single space between each variable value. The first line of the file contains a list of the variable names in the order in which they are written in the line.
- 4. Produces a report identical to style 3, but the first line is eliminated.
- 5. This style produces a fixed format which contains all variables, is blank delimited, and contains all records per case beginning with a household record which is followed by individual records. This style is intended for input to the bldspd program. Please refer to the *Tools User's Guide* for more details on the use of this style.

The default value of ASCSTYLE is 1.

ASCUNIT Text output family level

DESCRIPTION

When the text file output facility is activated using the ASCFLAG parameter, this control parameter is used to specify the family level of analysis of the resulting report. Valid values and their meanings are given below.

0 Individual
1 Nuclear Family
2 Census Family
3 Economic Family
4 Household

The default value for ASCUNIT is 0.

ASCVARS Variables selected for text output [string]

DESCRIPTION

When the text file output facility is activated using the ASCFLAG parameter, this control parameter is used to specify which variables are to be output in the resulting report. Analysis variables are rolled up to the family level specified by ASCUNIT, and class variables at lower levels refer to characteristics of the reference person of the family unit. Please see the <u>User's Guide</u> for a fuller discussion of family level in SPSD/M.

In Alberta, provincial surtax(impsur) is calculated as ASF percent of provincial taxes above the level ASCI plus AFTAX percent of taxable income (imitax).

AUTHOR

Name of person doing simulation [string]

DESCRIPTION

This control parameter is designed to be filled in by the user for documentation purposes.

AXM Age amount

DESCRIPTION

This is the maximum value of the age exemption/tax credit before any reductions are applied. If the parameter AOPT is set to 1, all filers age 65 and over receive the value of AXM as an age exemption. With AOPT set to 2, elderly filers receive the value of AXM as a non-refundable tax credit.

DESCRIPTION

This value is used to scale the amount of the reduction which will be applied to the age tax credit. It is used in 1994 to simulate the phase-in of the income testing of the age credit.

Legislation relating to this parameter was introduced in the 1994 Federal Budget which proposed that the non-refundable age tax credit "be subject to an income test which would target the assistance to seniors with low or modest incomes." This reduction for higher income seniors was to be phased in over two years, with half the reduction applied in 1994 and the full reduction in 1995 and subsequent years.

See also imatxc, AXM, AXRR, and AXTD.

AXRR Age amount credit reduction rate

DESCRIPTION

This parameter is the proportion of net income above a given threshold (AXTD) which will be deducted from the non-refundable age tax credit amount (AXM).

Legislation relating to this parameter was introduced in the 1994 Federal Budget which proposed that the non-refundable age tax credit "be subject to an income test which would target the assistance to seniors with low or modest incomes." Individual seniors with incomes above the threshold of AXTD would have the amount of the age credit reduced by AXRR proportion of income above that threshold. This reduction for higher income seniors was to be phased in over two years, with half the reduction applied in 1994 and the full reduction in 1995 and subsequent years.

See also imatxc, AXTD, AXPI.

AXTD	Age amount ne	t income turndown

DESCRIPTION

Individual seniors will have their non-refundable age tax credit reduced if their net income is above the value of this parameter.

Legislation relating to this parameter was introduced in the 1994 Federal Budget which proposed that the non-refundable age tax credit "be subject to an income test which would

target the assistance to seniors with low or modest incomes." Individual seniors with incomes above the threshold of AXTD would have the amount of the age credit reduced by AXRR proportion of income above that threshold. This reduction for higher income seniors was to be phased in over two years, with half the reduction applied in 1994 and the full reduction in 1995 and subsequent years.

AYPNDL Alta Pension Income Deduction Amount

DESCRIPTION

This is the maximum dollar amount of pension income which may be claimed as a Alberta non-refundable tax credit. The parameter is only used when the provincial tax on taxable income is calculated (ATXFLG = 1).

BAMTOPT

N.B. alternative minimum tax option (1=none, 2=% fed, 3=fed adjusted

net income)

DESCRIPTION

When New Brunswick tax on taxable income is calculated (BTXFLG = 1), there are three options as to how to calculate the provincial minimum tax.

When BAMTOPT is set to 1, then no provincial alternative minimum tax is calculated.

When BAMTOPT is set to 2, then a percentage (BAMTPCTF) of the additional federal tax due to the minimum tax is added to the basic provincial tax (imbpt).

When BAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the BAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

DESCRIPTION

This control parameter contains a label associated with the tax/transfer algorithm requested by the user through the BASMETH parameter. It is informational and cannot be directly modified by the user.

BASDESC Description of base parameters [string]

DESCRIPTION

This control parameter contains the descriptive label associated with the input parameter file or results file used to produce base variables. It is informational and cannot be directly modified by the user. It is a copy of the MPRDESC parameter associated with the file in question.

BASMETH Method of creating base variables

DESCRIPTION

This control parameter specifies the method of determining base results. May be one of 4 values:

- 0. No base results will be used during the current program run
- 1. Results will be read from an SPSM results file (.MRS) specified in INPBASMRS
- 2. Results will be calculated using the standard algorithm with tax/transfer parameters specified in INPBASMPR.
- 3. Results will be calculated using the alternate algorithm with tax/transfer parameters specified in INPBASMPR.

The default value for BASMETH is 0.

BAXM N.B. Age Amount

DESCRIPTION

This is the maximum value of the New Brunswick age non-refundable tax credit before any reductions are applied. The parameter is only used when a provincial tax on taxable income

BCBEMX B.C. Earned Income Benefit Income Reduction

DESCRIPTION

When BCEIBFLG is equal to 1, the British Columbia Earned Income Benefit (imibceib) is calculated depending on the number of children in the family. For families with lower incomes, the benefit starts to be phased in at BCEIBPI, and reaches its maximum at incomes of BCBEMX. The slope of the phase in is therefore calculated as the maximum working income supplement a family can receive divided by (BCBEMX – BCEIBPI).

BCEIBFLG Activate B.C. Earned Income Benefit Program

DESCRIPTION

When BCEIBFLG is assigned a value of 1, the calculation of the British Columbia Earned Income Benefit is activated, depending on the presence of children in the family. For families with lower incomes, the benefit starts to be phased in at BCEIBPI, and reaches its maximum at incomes of BCBEMX. The slope of the phase in is therefore calculated as the maximum working income supplement a family can receive divided by (BCBEMX – BCEIBPI).

With a value of 0, calculation of the British Columbia Earned Income Benefit is suppressed.

BCFBFLAG Activate B.C. Family Bonus Program

DESCRIPTION

The activation flag of the BC Family Bonus (imibcfb). The calculation is activated when the value is set to 1, no calculation if the value is zero.

The basic amount of benefits is related to the number of children in the family. This amount is reduced according to the net family income. A different reduction rate is used if the family include only one child.

BCFBNCS3 B.C. Family Bonus National Child Supplement for each additional child

DESCRIPTION

When BCFBIFS is flagged on, the Basic B.C. Family Bonus is reduced by the amount, if any, of the National Child Benefit Supplement received. This parameter represents the basic amount of the combined B.C. Family Bonus and National Child Supplement allowed for the third and subsequent child in the family to be used in the calculation of the B.C. Family Bonus (imibcfb).

See also BCFBNCSTD, BCFBNCSRR3.

BCFBNCSTD B.C. Family Bonus National Child Supplement Turndown

DESCRIPTION

When BCFBIFS is flagged on, the Basic B.C. Family Bonus is reduced by the amount, if any, of the National Child Benefit Supplement received. This parameter represents the family net income turndown level used to calculate the combined Family Bonus and National Child Benefit Supplement. When family net income exceeds this amount, the calculated bonus is reduced by BCFBNCSRR1 for families with one child, BCFBNCSRR2 for families with two children and by BCFBNCSRR3 for families with three or more children.

See also BCFBNCS1, BCFBNCS2, BCFBNCS3.

DESCRIPTION

When the parameter BCFBFLAG is set to one, the value of this parameter is always multiplied by the calculated amount of the B.C. Family Bonus (imibcfb). The parameter was designed to simulate the mid-year commencement of the program in July 1996.

BCFBTD B.C. Family Bonus Turndown

DESCRIPTION

The level of family net income (head plus spouse) above which the British Columbia Family Bonus (imibcfb) begins to be paid at a lower rate. If family income exceeds this amount, the Family Bonus will be reduced by a proportion (BCFBRR) of net income for families with two or more children or by (BCFBRRS) for families with one child.

BCGTC N.B. Caregiver Tax Credit

DESCRIPTION

BCGTC multiplied by BPNTCR is the maximum amount of the New Brunswick Caregiver Tax Credit (impcgtc). The parameter is only used when the provincial tax on taxable income is calculated (BTXFLG = 1).

For more explanation see BCGTCFLG.

DESCRIPTION

The calculation of the New Brunswick Caregiver Tax Credit (impcgtc) is activated by the flag BCGTCFLG.

The Caregiver Tax Credit (impcgtc) provides additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is BCGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate BCGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate BCGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, impcgtc, is reduced for each dollar of net income, iminet, in excess of BCGTCTD.

This non-refundable tax credit is only calculated when the provincial tax on taxable income is calculated (BTXFLG = 1).

BCGTCTC N.B. Caregiver tax credit take-up rate by age of elderly [age,rate]

DESCRIPTION

This is the first take-up rate used in the calculation of New Brunswick's impegte. It selects an individual with idefrh = 3 and assign him/her as a parent according to observed probability in SCF. The probability is also based on idage.

The parameter is only used when the provincial tax on taxable income is calculated (BTXFLG = 1).

BDTCR N.B. dividend tax credit rate

DESCRIPTION

This is the proportion of taxable dividends received (imidivt) which will be given for the

New Brunswick dividend tax credit (impdtxc). The parameter is only used when the provincial tax on taxable income is calculated (BTXFLG = 1).

CROSS REFERENCE

BEEPFLAG Beep on completion

DESCRIPTION

The BEEPFLAG parameter, if activated by setting its value to 1, will produce a beeping sound when SPSM execution is complete. Users may find this facility convenient if operating on multiple machines, or if busy on other tasks.

The default value is 0.

BEMXM N.B. equivalent to married amount

DESCRIPTION

This parameter represents the equivalent to married tax credit when New Brunswick tax is calculated as a tax on taxable income. It is only calculated when BTXFLG is set to 1.

BEMXMT N.B. equivalent to married turndown level

DESCRIPTION

This parameter represents the provincial equivalent to married exemption turndown when New Brunswick tax is calculated as a tax on taxable income. It is only used when BTXFLG is set to 1. The reduction is calculated as the dependant's net income less the turndown BEMXMT.

BMAXDX

N.B. Maximum Disability deduction/amount

DESCRIPTION

This value represents the maximum New Brunswick non-refundable disability tax credit. It is given to all individuals with a positive value for imputed Disability Deduction (imdisex). The parameter is only used when the provincial tax on taxable income is calculated (BTXFLG = 1).

BPNTCR N.B. provincial non-refundable tax credit rate

DESCRIPTION

This single parameter sets the tax credit rate for all of the non-refundable tax credits in New Brunswick. Each tax credit is calculated separately and summed for a total credit. The parameter is only used when a provincial tax on taxable income is calculated (BTXFLG = 1).

CROSS REFERENCE

ВРТХ	N R tax table [ta	axable income	b,basic provincial tax]
A/A A 4 A	11.D. tan table ta	muore meemie	,oubic provincial tax

DESCRIPTION

This table represents the New Brunswick tax curve used when calculating the tax on taxable income (BTXFLG = 1). The first column represents Taxable Income, the second represents the amount of Basic Provincial Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

BRKFLAG Activate interception of `Break' key

DESCRIPTION

This flag, which is normally left at 1, activates the normal SPSM break processing described in the <u>User's Guide</u>. If de-activated, SPSM will exit immediately to MS-DOS when the break key combination is pressed.

BSCI

New Brunswick provincial tax above which surtax applies

DESCRIPTION

In New Brunswick, provincial surtax (impsur) is calculated as BSF percent of provincial taxes above the level BSCI.

DESCRIPTION

This is the maximum value per person for the personal amount supplement available to low income Canadians. This measure was introduced in the Federal Budget in 1998 and cancelled in the 1999 budget. If the parameter PEROPT is set to 2 (for tax credits) all filers are income tested (based on taxable income imdepni) for receipt of the supplement to the basic exemption.

Note that in the federal tax forms, only persons whose incomes are over the personal tax amount (BXM) claimed this credit. By giving it to persons with very low incomes there is no effect on taxes or applied tax credits. But when comparing the SPSM results with those of the Greenbook, the SPSM results may seem high.

BXMSPI Basic personal exemption supplement phase in

DESCRIPTION

This is the phase-in and phase-out of the personal amount supplement available to low income Canadians. This measure was introduced in the Federal Budget in 1998 and cancelled in the 1999 budget. If the parameter PEROPT is set to 2 (for tax credits) all filers are income tested (based on taxable income imdepni) for receipt of the supplement to the basic exemption.

BXMSRR	Basic perso	nal exemption supp	lement reduction rate

DESCRIPTION

This is the proportion of net income above the level of the basic exemption (BXM) plus the maximum supplement (BXMS) used to reduce the maximum supplement to the federal basic personal tax credit (BXMS). This measure was introduced in the Federal Budget in 1998 and cancelled in the 1999 Federal Budget. If the parameter PEROPT is set to 2 (for tax credits) all filers are income tested (based on net income imdepni) for receipt of the supplement to the basic exemption.

CAMTOPT	B.C. alternative	minimum tax	option (1=	none, 2	2=% fed, 3=fe	d adjusted
net income)						

DESCRIPTION

When British Columbia tax on taxable income is calculated (CTXFLG = 1), there are three options as to how to calculate the provincial minimum tax.

When CAMTOPT is set to 1, then no provincial alternative minimum tax is calculated.

When CAMTOPT is set to 2, then a percentage (CAMTPCTF) of the additional federal tax due to the minimum tax is added to the basic provincial tax (imbpt).

When CAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the CAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

CAMTTX

B.C. amt rate as tax on adjusted income

DESCRIPTION

When British Columbia tax on taxable income is calculated (CTXFLG=1) and CAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the CAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

CCEALIM CCEA overall limit

DESCRIPTION

Upper limit to the amount of child care expenses that may be claimed. In the model, set to \$8000 from 1982-87. Changed as part of 1988 tax reform, the limit is expressed as a maximum per child and therefore is determined solely by the number of children.

CCEAOAGE CCEA Maximum eligible age for oldest child

DESCRIPTION

The child care expense allowance has two different levels of deductions depending on the child's age. This parameter sets the age of children above which child care expenses may not be claimed. Children below CCEAOAGE but above age 6 have their child care expense allowance imccea calculated with 'Limit C' set to CCEAOLD.

CCEAOLD CCEA old child limit

DESCRIPTION

Upper limit of the amount that can be claimed for older children. Used when applying limit "C" on the amount of CCE to be claimed. This dollar amount is applied to children between the ages of 7 and CCEAOAGE, or over CCEAOAGE with a severe and prolonged mental or physical imparement.

DESCRIPTION

Activates the child orientated expense variable in txccea. This redistributes expenses allowed back to the children by reducing the amount claimed for each child. When set to "1", actual expenses in FAMEX data (idccet) are used and subjected to Limits "A", "B" and "C". When set to "0", value is determined by idccett.

CCESFLAG CCE full-time student flag

DESCRIPTION

When this flag is set to 1, for full-time students who are single parents or where both parents are students, the Child Care Expense deduction is applied to all income (iminet) as opposed to earned income. CCEAEMPF is then applied to total income in these cases. The deduction must be smaller than the number of weeks in school full-time times the sum of CCESOLD times the number of eligible children 7 and over and CCESYNG times the number of children under 7.

CCEZOPT CCE young kid optimization rules [1=use, 2=zero, 3=optimize]

DESCRIPTION

This parameter is used to control the method by which child care expenses are handled for the calculation of the child tax credit/federal child benefits and child care exemption. When CCEZOPT is set to 1 then the family will always claim their child care expenses. When CCEZOPT is set to 2 then a family's child care expenses will never be claimed. When CCEZOPT is set to 3 then the function cceopt will be invoked to maximize the value of combined child care expense credits and the child tax credit/federal child benefits.

CCGTC	B.C. Care	egiver Tax Credit				

DESCRIPTION

CCGTC multiplied by CPNTCR is the maximum amount of the British Columbia Caregiver Tax Credit (impcgtc). The parameter is only used when the provincial tax on taxable income is calculated (CTXFLG = 1).

For more explanation see CCGTCFLG.

CCGTCFLG B.C. Caregiver Tax Credit activation flag

DESCRIPTION

The calculation of the British Columbia Caregiver Tax Credit (impcgtc) is activated by the flag CCGTCFLG.

The Caregiver Tax Credit (impcgtc) provides additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is CCGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate CCGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate CCGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, impcgtc, is reduced for each dollar of net income, iminet, in excess of CCGTCTD.

This non-refundable tax credit is only calculated when the provincial tax on taxable income is calculated (CTXFLG = 1).

CCGTCTC B.C. Caregiver tax credit take-up rate by age of elderly [age,rate]

DESCRIPTION

This is the first take-up rate used in the calculation of British Columbia's impogtc. It selects an individual with idefrh = 3 and assign him/her as a parent according to observed

probability in SCF. The probability is also based on idage.

The parameter is only used when the provincial tax on taxable income is calculated (CTXFLG=1).

CEMXMT B.C. equivalent to married turndown level

DESCRIPTION

This parameter represents the provincial equivalent to married exemption turndown when British Columbia tax is calculated as a tax on taxable income. It is only used when CTXFLG is set to 1. The reduction is calculated as the dependant's net income less the turndown CEMXMT.

CGIFLAG Capital gains inclusion in interest income deduction flag

DESCRIPTION

This parameter controls the inclusion of Taxable Capital Gains (imicapgt) in the calculation of income eligible for the Interest and Dividend Income Deduction. If GCIFLAG is assigned a value of 1, imicapgt is included. Given a value of 0, it is not included.

DESCRIPTION

The calculation of the Caregiver Tax Credit (imcgtc) is activated by the flag CGTCFLG.

Beginning in 1998, the Caregiver Tax Credit (imcgtc) was introduced to provide additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is CGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate CGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate CGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, imcgtc, is reduced for each dollar of net income, iminet, in excess of CGTCTD.

CGTCTC Caregiver tax credit take-up rate by age of elderly [age,rate]

DESCRIPTION

This is the first take-up rate used in the calculation of imcgtc. It selects an individual with idefrh = 3 and assigns him/her as a parent according to observed probability in SCF. The probability is also based on idage.

CLOSEFLAG Close window on completion

DESCRIPTION

The CLOSEFLAG parameter is used to control the behaviour of the windows version of SPSM when a simulation has been completed. If CLOSEFLAG is 1, SPSM will close the display window when the simulation has been completed. If CLOSEFLAG is 0, SPSM will leave its progress reporting window activated on completion, allowing the user to examine the summary statistics. Once the user has examined the summary statistics, he or she can close SPSM using the Close button. This parameter has no effect in the console version of SPSM.

This is the maximum value for the British Columbia labour sponsored funds tax credit (implvctc). The credit is derived as a proportion CLVCRT of the cost of the funds bought (idlabtxg) up to a maximum value CLVCMAX.

CPNTCR	B.C. provi	ncial non-refundable tax credit rate

DESCRIPTION

This single parameter sets the tax credit rate for all of the non-refundable tax credits in British Columbia. Each tax credit is calculated separately and summed for a total credit. The parameter is only used when a provincial tax on taxable income is calculated (CTXFLG = 1).

CPP60T64	CPP/QPP (Contributions Take	e up (60 - 64) by earnings with CPP income

DESCRIPTION

This is a take-up rate for contributions to CPP/QPP for individuals in the 60 to 64 age range who have received some CPP income (idicqp) as well as earned income (idiemp, idisenf,

idisefm). The take up is based on employment income and represent the proportion who should still contribute to CPP/QPP based on their earnings. Special tabulations using the Green Book data were used to determine the proportions.

CPPOPT

CPP/QPP contribution deduction/credit option [1=deduction,2=credit]

DESCRIPTION

This parameter controls the tax treatment of CPP/QPP contributions. With a value of 1, CPP/QPP contributions are treated as a deduction from net income and with a value of 2 as a tax credit.

CPPSEDEDFLG CPP/QPP contribution deduction for self-employed earnings flag

DESCRIPTION

When CPPSEDEDFLG is turned on, a fraction (CPPSEDFRC) of a person's contributions to the CPP/QPP in regards to their self employment earnings are treated as an exemption (imcppse) and is added to imdedftf. The rest, along with the contributions on wages and salaries, can still be claimed as a tax credit (imcppctc).

# **CPTCT** B.C. political contribution table [total donations,donation allowed]

#### **DESCRIPTION**

This table contains the figures necessary to calculate the British Columbia Political Contribution Tax Credit. The first column represents the dollar amount of total British Columbia political contributions to which the corresponding percentages of the third column are applied to calculate the total Allowable British Columbia Political Contribution Tax Credit. Only the first and third columns of the table need to be specified.

CPTX	B.C. tax table [tax]	axable income,	basic provincial tax]

This table represents the British Columbia tax curve used when calculating the tax on taxable income (CTXFLG = 1). The first column represents Taxable Income, the second represents the amount of Basic Provincial Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

**CSCI** British Columbia surtax first cut-in level

#### **DESCRIPTION**

This is the first level of provincial tax payable above which a surtax at the rate of CSF applies.

For British Columbia, the SPSM calculates provincial surtax (impsur) as CSF percent of provincial taxes (imtxp) above the level CSCI plus CSF2 percent of provincial taxes above the level CSCI2 less an allowance of CSDC for each dependant child (imchclm).

The rate which is applied to Provincial Income Tax (imtxp) exceeding CSCI2 to calculate the BC surtax. Thus the total rate of surtax above the second tier cut-in CSCI2 would be the sum of this parameter and CSF.

For British Columbia, the SPSM calculates provincial surtax (impsur) as CSF percent of provincial taxes (imtxp) above the level CSCI plus CSF2 percent of provincial taxes above the level CSCI2 less an allowance of CSDC for each dependant child (imchclm).

**CTCFALC** FAMEX reporting error adjustment: Alcohol [prov]

#### DESCRIPTION

The sum of the alcohol expenditures on the SPSD/M are known to be well below the provincial control totals. The role of this parameter is to scale the model expenditures to conform with these control totals. This is necessary as alcohol is amongst the most heavily taxed commodities.

**CTCFGAS** FAMEX reporting error adjustment: Gasoline [prov]

#### **DESCRIPTION**

The sum of the gasoline expenditures on the SPSD/M are not in alignment with the provincial control totals. This parameter is used to scale the gasoline expenditures to conform with provincial control totals. Like alcohol, gasoline is a heavily taxed commodity.

**CTCFTOB** FAMEX reporting error adjustment: Tobacco [prov]

#### **DESCRIPTION**

The sum of the tobacco expenditures on the SPSD/M fall short of provincial control totals. This parameter scales the model expenditures to conform with these control totals. Tobacco is the most heavily taxed commodity.

**CTCIFLAG** Refundable tax credits social assistance income inclusion flag

#### DESCRIPTION

This parameter controls the inclusion of Social Assistance Income (Federal Social Assistance, Provincial Social Assistance, the Guaranteed Income Supplement and the Provincial GIS Supplement) in the calculation of net income for the purpose of reducing the

Child Tax Credit and the Federal Sales Tax Credit. With a value of 0, Social Assistance income is excluded from net income, with a value of 1, it is included.

**CTCTD** 

Family income child tax credit turndown

#### **DESCRIPTION**

The level of family net income (head plus spouse) above which the Federal Child Tax Credit begins to be paid at a lower rate. If family income (the sum of the net income of the head and spouse) exceeds this amount the total Child Tax Credit is reduced by a proportion (CTCRR) of income exceeding the turndown CTCTD.

See CTCIFLAG for a description of the options to include Social Assistance income in the calculation of net income for the purpose of reducing the Child Tax Credit.

### **CTDFLAG** Commodity tax detailed calculation flag

## **DESCRIPTION**

If this flag is set to 0, commodity taxes are calculated at the total federal government and total provincial government level for each household. If the flag is turned on (set to 1) then 12 detailed tax types are calculated.

### **CROSS REFERENCE**

## **CTFAMSNA** FAMEX->SNA conceptual conversion factor [com]

### **DESCRIPTION**

There exist some conceptual differences between the expenditures of the input-output model which computes the effective commodity tax parameters and the SPSD/M observation stemming from survey data. This parameter is used to adjust the SPSD/M expenditures before applying the input-output commodity tax rates. For additional information on this issue, consult the *Commodity Tax User's Guide*.

**CTFCID** Federal custom import duties [com]

#### DESCRIPTION

This parameter represents the effective tax rates of one of six detailed federal commodity tax types. Custom import duties are levied on imported goods used for both manufacture and final demand consumption. They are ad-valorem based. Their impact is being diminished as the General Agreement on Tariffs and Trade (GATT) discussions lead to rate reductions. These levies are incorporated into the producer's price of a good such that revenues from the federal manufacturer's sales tax and other excise taxes are subject to their levels.

### **DESCRIPTION**

This parameter represents the effective tax rates of one of six detailed federal commodity tax types. Under the excise act duties are levied on tobacco products and alcoholic beverages (other than wines) made in Canada. These commodities are under the control of the crown until these duties are paid. They are then stamped accordingly. These duties, like custom import duties, are included in the producer's price of the commodity. They typically take the form of specific quantity rates; they are not ad-valorem taxes. Revenues generated by the manufacturers sales tax and federal excise takes are conditioned on these levels.

Function	Description

**CTFEXT** Federal excise taxes [com]

### DESCRIPTION

This parameter represents the effective tax rates of one of six detailed federal commodity tax types. Some commodities are additionally taxed on the producer price base through provisions in the Excise Tax Act. Taxes under this heading include: Gasoline, Diesel, and Aviation Fuel excise taxes; Tobacco and Alcohol excise taxes; Air transportation tax; Telecommunications programming tax; other excise taxes levied on heavy cars, air conditioners, jewelry, clocks, watches, lighters, playing cards etc.

**CTFMFG** Federal manufacturer's sales [com]

### **DESCRIPTION**

This parameter represents the effective tax rates of one of six detailed federal commodity tax types. It is levied on all finished manufactured goods at the producer's sales price irrespective of whether wholesalers, retailers, or individual consumers are the purchasers. It is levied upon the customs value of imported goods, including any applicable duty. For a list of exemptions see the *COMTAX Users Guide*.

**CTFOEN** Federal other energy taxes [com]

### **DESCRIPTION**

This parameter represents the effective tax rates of one of six detailed federal commodity tax types. These are taxes which were brought in under the 1981 National Energy Program. They

had significant impacts on Federal Government revenues through the early 1980s but by 1986 they have been phased out. They are as follows: Natural Gas & Gas Liquids Excise Tax; Oil Export Charges; Canadian Ownership Special Charge.

This parameter represents the effective tax rates of one of six detailed provincial commodity tax types. These profits are defined as the value of gross sales less administrative and general expenses. The value of gross sales is, in part, a function of the markups over costs the provincial government applies. These changes do not require statutory revisions.

**CTPRST** 

Provincial retail sales tax [com x prov]

### DESCRIPTION

This parameter represents the effective provincial sales tax rates, by expenditure category and province, on consumer's expenditure. Note that retail sales taxes associated with the business sector have been "pushed through" and are incorporated into CTPRST. Note also that effective tax rates are expressed with a "tax-free" consumption denominator. Please see the *Consumer Tax User's Guide* for a more complete exposition on effective tax rates.

**CTPTOB** Provincial tobacco tax [prov]

## **DESCRIPTION**

This parameter represents the effective tax rates of one of six detailed provincial commodity tax types. This tax is applied to cigarettes and cut tobacco. In both cases it is a specific rate tax either by cigarette or by the gram.

### **CTPTOT**

provincial total retail tax equivalent

#### **DESCRIPTION**

This is a derived parameter calculated in mpc.c parameter controls the way in which commodity taxes are calculated. It is a total across all commodities of retail sales tax, provincial industrial commodity taxes, and rates for other specific commodity taxes.

#### **CROSS REFERENCE**

Function	Description
ctmod mpc txhhexp	Compute commodity taxes for individuals and households Calculate derived model parameters and do edits Compute and pro-rate household taxes, rent, etc.
CTSAVE	All positive savings

### **DESCRIPTION**

This parameter is the scaling factor supplied by the user to allow for adjustments to household savings.

# **CROSS REFERENCE**

Function	Description

CTTXRM	Base year	commodity tax remo	oval factor [com x prov]

# **DESCRIPTION**

The Input - Output based effective tax rates are generated with a denominator net of taxes to facilitate direct interpretation of alternate commodity tax regimes. Since the household

expenditure observations on the SPSD are inclusive of survey year taxes, this factor must first be applied to the data before alternate effective rates can be properly used.

# **CTXFLG** B.C. tax on taxable income activation flag

### **DESCRIPTION**

When this flag is turned on, British Columbia taxes get calculated as a tax on taxable income instead of as a percentage of federal taxes.

**DISOPT** Disability deduction/credit option [1=deduction,2=credit]

# **DESCRIPTION**

If this parameter is assigned a value of 1, the value MAXDX is assigned to the modeled disability exemption variable imdisex for all individuals with a reported disability exemption (i.e. a non-zero value for iddisslf). When DISOPT has a value of 2, MAXDX is assigned as a tax credit to the variable imdisatc.

#### **DISTFLAG** Distribution facility activation flag

#### **DESCRIPTION**

This control parameter activates the distributional analysis facility of SPSM, which allows the user to produce certain distributional reports on an SPSD/M variable.

**DISTP** Breakpoints for histogram plot [array]

#### **DESCRIPTION**

This control parameter, when activated by DISTFLAG, is a vector of decile cutpoints used on the horizontal axis of the histogram frequency plot. Only values which fall between the first and last values of DISTP are used to produce the plot, so that DISTP also functions to truncate tails of the distribution for display purposes.

### **DISTPHGT** Height of histogram plot

#### **DESCRIPTION**

This control parameter, when activated by DISTFLAG, controls the number of vertical print positions used to produce the histogram plot. If this number is increased, the histogram plot can show a greater amount of detail.

The default value of DISTPHGT is 17.

#### DESCRIPTION

This control parameter, when activated by DISTFLAG, controls the number of horizontal print positions used to produce the histogram plot. If this number is increased, the plot can show a greater amount of detail.

The default value of DISTPWID is 70.

**DISTSAMP** Distribution facility sample size

#### **DESCRIPTION**

This control parameter, when activated by DISTFLAG, controls how many sample observations are maintained in memory for computing deciles and the histogram plot. If this number is increased, the deciles can be computed more accurately, but at the cost of increased use of the computer memory.

The default value of DISTSAMP is 3000.

**DISTUNIT** Distribution facility family level

#### DESCRIPTION

When the distribution facility report is activated using the DISTFLAG parameter, this control parameter is used to specify the family level of analysis of the resulting report. Valid values and their meanings are given below.

- 0. Individual
- 1. Nuclear Family
- 2. Census Family
- 3. Economic Family
- 4. Household

The default value for DISTUNIT is 0.

#### **DESCRIPTION**

The value of the DISTVAR control parameter is any valid class or analysis variable name for which a histogram plot and distributional statistics are desired. The value of DISTFLAG must be set to 1 or this parameter will be ignored.

**DISTZERO** Distribution facility zero inclusion flag

#### **DESCRIPTION**

This control parameter, when activated by DISTFLAG, controls whether or not observations of the variable specified by DISTVAR with value zero are to be included when producing the distribution reports.

The default value of DISTZERO is 1.

#### **DNINCFLAG** Disable no income flag for calculation

#### DESCRIPTION

For efficiency purposes the SPSM sets a flag when an individual has no income and skips several calculations as a result. If an individual receives income in the course of a simulation the flag is turned. If DNINCFLAG is set to one then the income flag will be set to one for all individuals. This will result in no difference in model results but the model will take approximately 30% longer to execute.

**EAMAX** Maximum employment expenses

#### **DESCRIPTION**

The General Employment Expense Deduction is calculated by taking a proportion (EAPRP) of earnings from employment (idiemp). If the result exceeds EAMAX is set to this amount. This parameter is used only if EAOPT is set to 1 (for deductions).

#### **EARNMIN**

Earnings threshold to be an earner

#### **DESCRIPTION**

This parameter, found in the database adjustment (.apr) parameter file, is used to specify the minimum employment and self-employment income an individual must have in order to be considered an "earner". This value is used to produce the class variables nfnearn, cfnearn, efnearn, and hdnearn.

#### **EDUCOPT**

Education deduction/credit option [1=deduction,2=credit]

#### DESCRIPTION

This parameter controls the tax treatment of the Education Deduction. With a value of 1, the Education Deduction is treated as a deduction from net income and with a value of 2 as a tax credit.

# **EMPLOFLAG** Database variable(emplo) activation flag

#### **DESCRIPTION**

When this parameter is set to 1, the imputed variable for the employee home relocation deduction (idemplo) is included in the calculation of all deductions from net income (imdedfn) as well as being a deduction from net income (iminet) when calculating the federal foreign tax credit (imfortxc). With a value of zero the employee home relocation deduction variable is not used.

# EMXM Married equivalent exemption/amount

# **DESCRIPTION**

If the parameter PEROPT is set to 1 (for personal exemptions), a head with no spouse may claim a dependent child for this amount for the Married Equivalent Exemption. The exemption is reduced by the child's net income exceeding the turndown level (EMXMT).

**ETAFLAG** Activate fraction completed display

#### **DESCRIPTION**

When activated, ETAFLAG will cause SPSM to generate a horizontal histogram which indicates an estimate of what percentage of the requested simulation has been completed. Note that the estimate will not be particularly accurate when selecting small samples.

The default value for ETAFLAG is 1.

**FACTISENF** Scale-up factor for non-farm self-employment income

#### DESCRIPTION

This parameter can be used to "gross-up" non-farm self-employment income before applying the federal tax algorithm. It does not increase the real income received by an individual, but rather increases the amount of income used when calculating taxes. It is intended to be used to simulate the effect of reducing the deductibility of employment expenses. If this kind of simulation is not desired, FACTISENF should be set to the value 1.0.

#### **FARR**

Family allowance repayment rate

#### **DESCRIPTION**

This parameter allows the repayment of Family Allowance based on net family income. If set to 0, Family Allowances are not repaid. If set to 1, the amount repaid is calculated as the lesser of Taxable Family Allowances (imtfa) or a proportion FARR of family net income exceeding the reduction level FATD. The repayment amount is added to the variable imrepay and is not considered a deduction from net income.

**FCBEIE** Flag for WIS dependent on number of children

#### **DESCRIPTION**

This parameter controls whether the original earned income supplement (also known as the working income supplement) is used, or whether the enriched version, with different amounts depending on the number of children in the family, is used. When FCBEIE is set to 0, the original earned income supplement is used. When it is set to 1, the enriched working income supplement proposed in the 1997 budget is calculated.

#### **FCBEIS**

Child benefits earned income supplement

#### DESCRIPTION

This parameter represents the amount of the federal earned-income supplement which increases the Federal Child Benefit for low-income working families. When FCBEIE is set to 1, the benefit depends on the number of children. FCBEIS is replaced by FCBEIS1, FCBEIS2, and FCBEIS3.

### FCBEIS3 Enriched WIS for each additional child

### **DESCRIPTION**

This parameter represents the amount received for the third and additional children in a family from the proposed enriched federal earned-income supplement which increases the Federal Child Benefit for low-income working families (1997 Budget).

**FCBEMX** Earnings where WIS phase-in is at maximum

### **DESCRIPTION**

When FCBEIE is equal to 1, the Working Income supplement depends on the number of children in the family. For families with lower incomes, the benefit starts to be phased in at FCBECI, and reaches its maximum at incomes of FCBEMX. The slope of the phase in is therefore calculated as the maximum working income supplement a family can receive divided by (FCBEMX – FCBECI).

## **FCBERR** Child benefits earning supplement reduction rate

### **DESCRIPTION**

This parameter represents the rate at which the earned income supplement (FCBEIS) will be reduced by when family net income exceeds the (FCBETD) turn down level. When FCBEIE is set to 1, the reduction rate depends on the number of children and FCBERR1, FCBERR2, and FCBERR3 replace FCBERR.

### **FCBESR** Child benefits earned income supplement rate

#### **DESCRIPTION**

This parameter represents the rate at which the earned income supplement (FCBEIS) will be increased when family net income exceeds the (FCBECI) cut-in level. When FCBEIE is set to1, this parameter is replaced by FCBEMX since the rate of increase will depend on the number of children in the household.

**FCBTD** Federal child benefits family income turndown

### **DESCRIPTION**

The level of family net income (head plus spouse) above which the Federal Child Benefit begins to be paid at a lower rate. If family income exceeds this amount, the Child Benefit will be reduced by a proportion (FCBRR) for families with two or more children or by (FCBRRS) for families with one child.

**FLVCMAX** Maximum labour-sponsored funds tax credit allowed

#### **DESCRIPTION**

This is the maximum value for the federal labour sponsored funds tax credit (imlabtxc). The credit is derived as a proportion FLVCRT[prov] of the cost of the funds bought (idlabtxg) up to a maximum value FLVCMAX.

Note that in 1996, people who bought shares prior to March 6 could claim a 20% rate whereas shares bought afterwards had a 15% rate. In the model we simply use a 15% rate.

**FLVCRT** Percent of labour-sponsored funds cost allowed as credit [prov]

### **DESCRIPTION**

This is the rate for the federal labour sponsored funds tax credit (imlabtxc). The credit is derived as a proportion FLVCRT[prov] of the cost of the funds bought (idlabtxg) up to a maximum value FLVCMAX.

Prior to 1988, the federal government provided a credit only if the province already such a program in place.

Note that in 1996, people who bought shares prior to March 6 could claim a 20% rate whereas shares bought afterwards had a 15% rate. In the model we simply use a 15% rate.

## **FPTC** Federal political contribution table [total donations,donation allowed]

### **DESCRIPTION**

This table contains the figures necessary to calculate the Federal Political Contribution Tax Credit. The first column represents the dollar amount of total federal political contributions to which the designated percentages of the third column are applied to calculate the total Allowable Federal Political Contribution Tax Credit. Only the first and third columns of the table need to be specified.

**FSTCF** Federal sales tax credit amount for filer

### **DESCRIPTION**

This parameter represents the basic Federal Sales Tax Credit claimable for the filer. The total family sales tax credit (on behalf of the head, spouse and dependants) is reduced by a fraction (FSTCR) of family net income (head and spouse) exceeding the turndown level (FSTCL).

**FSTCL** Federal sales tax credit reduction level

#### **DESCRIPTION**

The level of family net income above which the total family Federal Sales Tax Credit is reduced.

Note that non-taxable Social Assistance income may or may not be included in the calculation of net income for this reduction depending upon the status of CTCIFLAG. Social Assistance income includes federal and provincial Social Assistance, the Guaranteed Income Supplement, Spouses Allowance and income from Provincial GIS supplementation programs.

This parameter is used only if FSTCFLAG is set to 1.

<b>FSTCREF</b>	Federal sales tax	credit reform	- age

When FSTCREF is set to 1, only people 19 years and over can apply for the federal sales tax credit. Parents can claim FSTCC for each child 18 and younger.

Otherwise, if FSTCREF is set to 0, the credit can be received at the age of 18, and only children 17 and younger can be claimed by their parents.

### **DESCRIPTION**

This represents the maximum value of the Federal Surtax Reduction.

Note that when the surtax reduction is being phased in or out at 50%, the maximum value as well as the reduction rate (FSURTRRR) should be half the value as printed on the tax form.

# **FSURTRR** Federal surtax reduction reduction rate

#### **DESCRIPTION**

The Federal Surtax Reduction is reduced by this proportion (FSURTRRR) of Basic Federal Tax (imbft) exceeding the level (FSURTRRL).

Note that when the surtax reduction is being phased in or out at 50%, this reduction rate as well as the maximum value (FSURTRMX) should be half the value as printed on the tax form.

**FTX** Federal tax table [taxable income,basic federal tax]

### **DESCRIPTION**

This table represents the Federal tax curve. The first column represents Taxable Income, the second represents the amount of Basic Federal Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

#### **FXVFLAG** Read FAMEX expenditure vector file

### **DESCRIPTION**

When this flag is set to 1, expenditure totals and commodity tax simulations are performed.

The default value for FXVFLAG is 1.

**GFADDDED** Growth Factor: Additional deductions from net income (256)

#### **DESCRIPTION**

The value for Additional Deductions from Net Income (idaddded) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFALEXP** Growth Factor: Other allowable employment expenses (229)

#### **DESCRIPTION**

During database adjustment, the database value for Other Allowable Employment Expenses (idalexp) is always multiplied by this value.

**GFCAPGEX** Growth Factor: Capital gains exemptions (254)

#### **DESCRIPTION**

The value for Capital Gains Exemptions (idcapgex) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFCARRY** Growth Factor: Carrying charges (221)

#### **DESCRIPTION**

During database adjustment, the database value for Carrying Charges (idcarry) is always multiplied by this value.

**GFCCET** Growth Factor: Child care expenses associated with child

#### **DESCRIPTION**

When CTFLAG are set to 1, the database value of household expenditure on Child Care (idccet) is always multiplied by this factor.

**GFCCETT** Growth Factor: Child care expenses (Limit A, Form T778)

#### **DESCRIPTION**

The value for Child Care Expenses (idccett) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFCHARIT** Growth Factor: Charitable donations (340)

#### DESCRIPTION

During database adjustment, the database value for Charitable Donations (idcharit) is always multiplied by this value. This, combined with new weights, allows data from the base year to represent current year values.

During database adjustment, the database value for Previous Years Capital Losses (idcloss) is always multiplied by this value.

**GFCPP65** Growth Factor: CPP for age 65

#### DESCRIPTION

This parameter allows the growth of CPP/QPP benefits for recipients aged 65 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 65 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCPP66** Growth Factor: CPP for age 66

#### **DESCRIPTION**

This parameter allows the growth of CPP/QPP benefits for recipients aged 66 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 66 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCPP67** Growth Factor: CPP for age 67

#### DESCRIPTION

This parameter allows the growth of CPP/QPP benefits for recipients aged 67 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 67 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

This parameter allows the growth of CPP/QPP benefits for recipients aged 68 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 68 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCPP69** Growth Factor: CPP for age 69

#### DESCRIPTION

This parameter allows the growth of CPP/QPP benefits for recipients aged 69 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 69 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCPP70** Growth Factor: CPP for age 70

#### DESCRIPTION

This parameter allows the growth of CPP/QPP benefits for recipients aged 70 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 70 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCPP71** Growth Factor: CPP for age 71

#### **DESCRIPTION**

This parameter allows the growth of CPP/QPP benefits for recipients aged 71 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 71 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

This parameter allows the growth of CPP/QPP benefits for recipients aged 72 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 72 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCPP73** Growth Factor: CPP for age 73

#### DESCRIPTION

This parameter allows the growth of CPP/QPP benefits for recipients aged 73 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 73 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCPP74** Growth Factor: CPP for age 74

#### DESCRIPTION

This parameter allows the growth of CPP/QPP benefits for recipients aged 74 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 74 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCPP75** Growth Factor: CPP for age 75

#### **DESCRIPTION**

This parameter allows the growth of CPP/QPP benefits for recipients aged 75 years. During database adjustment, the database value for CPP/QPP Benefits for individuals aged 75 years (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

This parameter allows the growth of CPP/QPP benefits for recipients aged 76 or over. During database adjustment, the database value for CPP/QPP Benefits for individuals over age 75 (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCPPL65** Growth Factor: CPP for age < 65

#### DESCRIPTION

This parameter allows the growth of CPP/QPP benefits for recipients aged 64 or younger. During database adjustment, the database value for CPP/QPP Benefits for individuals under age 65 (idicqp) is always multiplied by this value. Separate growth factors by age allow for the phasing in of the program.

**GFCQP** Adjustment Factor: CPP/QPP contributions

#### DESCRIPTION

When CTFLAG is set to 1, the database value of household CPP/QPP Contributions (fxcqp) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFDALIMO** Growth Factor: Alimony paid (220)

#### DESCRIPTION

The value for Alimony Paid (iddalimo) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

The value for Disability Amount for Dependants (iddisoth) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFDISSLF** Growth Factor: Disability amount for self (316)

#### **DESCRIPTION**

The value for Disability Amount for Self (iddisslf) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFDUES** Growth Factor: Union and professional dues (212)

#### DESCRIPTION

During database adjustment, the database value for the Deduction for Professional and Union Dues (imputed from T1 records, iddues) is always multiplied by this value.

**GFEMPLO** Growth Factor: Employee home relocation loan dedn (248)

#### DESCRIPTION

The value for Employee Home Relocation Loan Deduction (idemplo) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFEXPLOR** Growth Factor: Exploration and development expenses (224)

#### DESCRIPTION

The value for Exploration and Development Expenses (idexplor) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

When CTFLAG is set to 1, the database value of household Account Balancing Difference (fxfabd) is always multiplied by this factor.

**GFFDSFT** Growth Factor: Foreign tax credit applied to surtax (511)

#### **DESCRIPTION**

This growth factor is used to adjust the new database variable idfdsft.

**GFFMX** Adjustment Factor: consumer expenditure categories [commodity]

#### DESCRIPTION

This factor is used in conjunction with commodity tax modeling. There exist some known discrepancies in consumer expenditure categories between the FAMEX and other reliable data sources. This factor has been provided to adjust the FAMEX levels up or down to reduce the differences in the following important commodity tax areas:

- 0. Food and Non-alcoholic Beverages
- 1. Alcoholic Beverages
- 2. Tobacco products
- 3. Men's & Boy's Clothing
- 4. Men's and boy's clothing repair & alteration
- 5. Women's and children's clothing
- 6. Women's clothing, repair & alteration
- 7. Footwear
- 8. Shoe repair
- 9. Gross imputed rent
- 10. Gross rent paid
- 11. Other shelter expenses
- 12. Electricity
- 13. Natural gas
- 14. Other fuels
- 15. Furniture and floor covering
- 16. Upholstery and furniture repairs
- 17. Household appliances
- 18. Household equipment repairs

- 19. Semi-durable household furnishings
- 20. Non-durable household supplies
- 21. Domestic and child care services
- 22. Other household services
- 23. Medical care
- 24. Hospital care and the like
- 25. Accident and sickness insurance
- 26. Drugs and pharmaceutical products
- 27. New and used (net) motor vehicles
- 28. Motor vehicles parts and accessories
- 29. Motor vehicle repairs
- 30. Motor fuels and lubricants
- 31. Other motor vehicle related services
- 32. Purchased transportation
- 33. Communications
- 34. Recreation, sporting and camping equip.
- 35. Recreation equipment repair and rentals
- 36. Reading and entertainment supplies
- 37. Recreational services
- 38. Educational and cultural services
- 39. Jewelry and watches
- 40. Jewelry and watch repair
- 41. Leather goods & other personal effects
- 42. Toilet articles and cosmetics
- 43. Personal care
- 44. Restaurants and accommodation services
- 45. Financial, legal & other services
- 46. Operating expenditures of non-profit org.
- 47. Net expenditure abroad

**GFFOMR** Adjustment Factor: Other money receipts

#### DESCRIPTION

When CTFLAG is set to 1, the database value of household Other Money Receipts (fxfomr) is always multiplied by this factor.

**GFFORAVG** Growth Factor: Forward averaging amount withdrawal (237)

#### DESCRIPTION

The value for Forward Averaging Amount Withdrawal (idforavg) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFFORINC** Growth Factor: Net foreign income (508)

### **DESCRIPTION**

The value for Net Foreign Income (idforinc) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFFORTX** Growth Factor: Foreign tax paid (507)

#### **DESCRIPTION**

The value for Foreign Tax Paid (idfortx) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFGIFTS** Growth Factor: Gifts to Canada/provinces/culture (342)

#### **DESCRIPTION**

The value for Gifts to Canada/Provinces/Culture (idgifts) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFGSTREB** Growth Factor: GST rebate (457)

#### **DESCRIPTION**

The value for GST rebate (457) (idgstreb) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFGVPEN** Adjustment Factor: Government pension plan contributions

#### **DESCRIPTION**

When CTFLAG is set to 1, the database value of household Government Pension Plan Contributions (fxgvpen) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

When CTFLAG is set to 1, the database value of household Market value of home, fxhmkt, is always multiplied by this value.

**GFHMORT** Adjustment Factor: Mortgage value outstanding

#### **DESCRIPTION**

When CTFLAG is set to 1, the database value of household Mortgage value outstanding, fxhmort is always multiplied by this value.

**GFHOMSTU** Growth Factor: College residence/resident homeowner assistance (558)

#### DESCRIPTION

The value for College Residence/Resident Homeowner Assistance (idhomstu) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFHOSSLF** Growth Factor: Ontario HOSP contributions - self (598)

#### **DESCRIPTION**

The value for Ontario HOSP Contributions - Self (idhosslf) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFHOSSPO** Growth Factor: Ontario HOSP contributions - spouse (599)

#### **DESCRIPTION**

The value for Ontario HOSP Contributions (idhosspo) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFIALIMO** Growth Factor: Alimony Income

### **DESCRIPTION**

The value for Alimony income received (idialimo) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFICAPG** Growth Factor: Capital gains (actual) (127 * 1.5)

#### **DESCRIPTION**

During database adjustment, the database value for Capital Gains/Losses (idicapg) is always multiplied by this value.

**GFIDIV** Growth Factor: Dividend income (actual) (120 / 1.5)

#### **DESCRIPTION**

During database adjustment, the database value for Dividends (ididiv) is always multiplied by this value.

**GFIEMP** Growth Factor: Employment income [province,sex]

#### **DESCRIPTION**

This Vector allows the growth of Employment Income (idiemp). This is a two dimensional parameter indexed by province and sex of worker.

Users should note that when using the UI and TX standard algorithms together the values of GFIEMP are applied using different algorithms.

During database adjustment, the database value for Interest Income (idiint) is always multiplied by this value.

**GFILOSS** 

Growth Factor: Business investment losses (217)

### **DESCRIPTION**

During database adjustment, the database value for Investment Losses (idiloss) is always multiplied by this value.

**GFINOGV** 

Growth Factor: Other government income (non-taxable)

#### DESCRIPTION

During database adjustment, the database value for Non-taxable Other Government Income (idinogy) is always multiplied by this value.

**GFINOTH** 

Growth Factor: Other money income (non-taxable)

#### DESCRIPTION

During database adjustment, the database value for Non-taxable Other Income (idinoth) is always multiplied by this value.

**GFINTAX** 

Adjustment Factor: Income taxes

#### DESCRIPTION

When CTFLAG is set to 1, the database value of household Income Taxes (fxintax) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

Parameter Guide Version 8.1

When CTFLAG is set to 1, the database value of household expenditure on Interest on Personal Loans (fxintpl) is always multiplied by this factor.

**GFIOINV** 

Growth Factor: Other investment income with net rental

### **DESCRIPTION**

During database adjustment, the database value for Other Investment Income (idioinv) is always multiplied by this value.

**GFIPAC** 

Adjustment Factor: Life insurance premiums and annuity contributions

#### **DESCRIPTION**

The value for Life Insurance Premiums and Annuity Contributions (fxipac) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFIPENS** 

Growth Factor: Pension income (115)

#### **DESCRIPTION**

During database adjustment, the database value for Pension Income (idipens) is always multiplied by this value.

**GFISA** 

Growth Factor: Social assistance income

#### **DESCRIPTION**

During database adjustment, the database value for Social Assistance (idisa) is always multiplied by this value.

During database adjustment, the database value for Self-employed Farm Income (idisefm) is always multiplied by this value.

**GFISENF** 

Growth Factor: Self-employed income - non-farming

#### DESCRIPTION

During database adjustment, the database value for Self-employed Non-farm Income (idisenf) is always multiplied by this growth factor.

**GFITC** 

Growth Factor: Federal investment tax credits (412)

#### DESCRIPTION

During database adjustment, the database value for Federal Investment Tax Credit (iditc) is always multiplied by this value.

**GFITOGV** 

Growth Factor: Other government income (taxable)

#### DESCRIPTION

During database adjustment, the database value for Taxable Other Government Income (iditogy) is always multiplied by this value.

**GFITOTH** 

Growth Factor: Other non-government income (taxable)

#### DESCRIPTION

During database adjustment, the database value for Taxable Other Income (iditoth) is always multiplied by this value.

**GFITRRSP** 

Growth Factor: Taxable RRSP withdrawls

#### DESCRIPTION

The value for Taxable RRSP withdrawals (iditrrsp) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFIVETP** 

**Growth Factor: Veterans Pensions** 

### DESCRIPTION

The value for Veterans pensions and allowances (idivetp) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFIWORKC** Growth Factor: Worker's compensation

#### DESCRIPTION

The value for Workers compensation benefits (idiworkc) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFLABTXG** Growth Factor: Labour funds tax credit (414)

#### DESCRIPTION

The value for the Labour Funds Tax Credit (idlabtxc) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFMEDGRO** Growth Factor: Medical expenses, gross (330)

#### DESCRIPTION

The value for Gross Medical Expenses (idmedgro) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

The value for Minimum Tax Carryover (idmincar) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFMORTI** Adjustment Factor: Mortgage interest paid

### **DESCRIPTION**

When CTFLAG is set to 1, the database value of household Mortgage interest paid, fxmorti, is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFMOVEXP** Growth Factor: Imputed moving expenses (219)

#### **DESCRIPTION**

The value for Imputed Moving Expenses (idmovexp) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFMSCHPD** Growth Factor: Manitoba school taxes paid

#### DESCRIPTION

The value for Manitoba school taxes paid (idmschpd) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFNCAL** Adjustment Factor: Net change in assets and liabilities

#### DESCRIPTION

When CTFLAG is set to 1, the database value of Net Change in Assets and Liabilities (Savings) (fxncal) is always multiplied by this factor. This allows for the growth from a base year to represent current year values.

During database adjustment, the database value for Other Years Non-Capital Losses (idnclos) is always multiplied by this value.

**GFNES** Adjustment Factor: Not elsewhere stated

#### DESCRIPTION

When CTFLAG is set to 1, the database value of household expenditures not included in other defined expenditure Categories (fxnes) is always multiplied by this factor. This allows for the growth from a base year to represent current year values.

**GFNORTH** Growth Factor: Northern deductions (255)

#### **DESCRIPTION**

The value for Northern Deductions (idnorth) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFOTHDED** Growth Factor: Other deductions from total income (232)

#### **DESCRIPTION**

The value for Other Deductions from Total Income (idothded) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFOTHPE** Growth Factor: Other dependant exemptions (305)

#### **DESCRIPTION**

During database adjustment, the database value for Other Personal Exemptions (idothpe) is always multiplied by this value.

**GFPARTLO** Growth Factor: Limited partnership losses (251)

### **DESCRIPTION**

The value for Limited Partnership Losses (idpartlo) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFPOLCON** Growth Factor: Federal political contributions (409)

#### **DESCRIPTION**

The value for Federal Political Contributions (idpolcon) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFPROPTX** Growth Factor: Net property taxes paid (556)

#### **DESCRIPTION**

The value Net Property Taxes Paid (idproptx) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFPRTAX** Adjustment Factor: Property tax

#### **DESCRIPTION**

When CTFLAG is set to 1, the database value of household Property Tax (fxprtax) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFPRVFTC** Growth Factor: Provincial foreign tax credit (Form T2036)

#### **DESCRIPTION**

The value for the Provincial Foreign Tax Credit (idprvftc) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFPRVPOL** Growth Factor: Provincial political contributions (565)

### **DESCRIPTION**

The value for Provincial Political Contributions (idprvpol) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFPVPEN** Adjustment Factor: Private pension plan contributions

#### **DESCRIPTION**

When CTFLAG is set to 1, the database value of household Private Pension Plan Contributions (fxpvpen) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFRECOM** Adjustment Factor: Real estate commissions

#### **DESCRIPTION**

When CTFLAG is set to 1, the database value of household Real Estate Commissions (fxrecom) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFRENTPD** Growth Factor: Total rental payments (555)

#### **DESCRIPTION**

The value for Total Rental Payments (idrentpd) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFRFEES** Adjustment Factor: Registration and license fees

#### **DESCRIPTION**

When CTFLAG is set to 1, the database value of household Registration and License Fees

(fxrfees) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFRPP** Growth Factor: Registered pension plan contributions (207)

### **DESCRIPTION**

During database adjustment, the database value for RPP Contributions (idrpp) is always multiplied by this value.

**GFRRSP** Growth Factor: RRSP contributions (208)

#### **DESCRIPTION**

During database adjustment, the database T1 imputed value for RRSP Contributions (idrrsp) is always multiplied by this value.

**GFRRSPT** Adjustment Factor: Total RRSP contributions (FAMEX)

### **DESCRIPTION**

When CTFLAG is set to 1, the database value of household expenditure on Registered Retirement Savings Plans as reported in the FAMEX survey (fxrrspt) is always multiplied by this factor. This allows for the growth from a base year to represent current year values.

**GFSAPRED** Growth Factor: Predicted benefits from Social Assistance

#### DESCRIPTION

The value for Predicted amount of SA received (idsapred) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFSCFCQP** Growth Factor: SCF CPP

### **DESCRIPTION**

The value for SCF Canada and Quebec pension plans (idscfcqp) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFSCFCTC** Growth Factor: Child tax credit

### **DESCRIPTION**

The value for Child Tax Credits (idscfctc) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFSCFFTC** Growth Factor: Federal tax credit

#### DESCRIPTION

The value for the Federal Tax Credit (idscfftc) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFSCFINT** Growth Factor: SCF interest income

#### DESCRIPTION

The value for SCF interest income (idscfint) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFSCFOAS** Growth Factor: Old age security

#### DESCRIPTION

The value for Old Age Security (idscfoas) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

Parameter Guide Version 8.1 **GFSCFPTC** Growth Factor: SCF provincial tax credits

#### **DESCRIPTION**

The value for Provincial tax credits as reported on SCF (idscfptc) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFSCFSA** Growth Factor: SCF social assistance

### **DESCRIPTION**

The value for SCF social assistance (idscfsa) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFSCFUIB** Growth Factor: Unemployment insurance benefits

#### DESCRIPTION

The value for Unemployment Insurance Benefits (idscfuib) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFSTKDED** Growth Factor: Stock option deduction (249)

#### DESCRIPTION

The value for the Stock Option Deduction (idstkded) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFTPTAX** Adjustment Factor: Transfer of property taxes

#### DESCRIPTION

When CTFLAG is set to 1, the database value of household Transfer of Property Taxes (fxtptax) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

During database adjustment, the database value for Tuition Fees (idtuitn) is always multiplied by this value.

**GFUIC** 

Adjustment Factor: UI contributions

### DESCRIPTION

When CTFLAG is set to 1, the database value of household expenditure on Unemployment Insurance Contributions (fxuic) is always multiplied by this factor.

**GFUIPRED** 

Growth Factor: Predicted benefits from UI

#### DESCRIPTION

The value for Predicted amount of UI received (iduipred) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

**GFVENCAP** Growth Factor: Venture capital tax credit (564)

#### DESCRIPTION

The value for the Venture Capital Tax Credit (idvencap) is always multiplied by this value. This allows for the growth from a base year to represent current year values.

GISBE1

Breakeven for GIS one pensioner couple

#### DESCRIPTION

GISBE1 represents the level of family income at which the GIS benefits of a pensioner married to a non-pensioner have been reduced to exactly zero. This is a derived parameter calculated in mpc.c. The figure is calculated as a fixed relationship to other input parameters as follows.

#### **CROSS REFERENCE**

Function Description

mpc Calculate derived model parameters and do edits

**GISBE2** Breakeven for GIS/SPA couple

#### DESCRIPTION

This is a derived parameter calculated in mpc.c. GISBE2 represents the level of family income at which the combined GIS and SPA benefits of a pensioner married to a SPA recipient have been reduced to exactly zero.

GISBE2 = (MP.BGISM*2) / (MP.GISRRM*2) + MP.BOAS / MP.SPAOASRR + MP.GISRLM

#### CROSS REFERENCE

Function Description

gis Compute GIS/SPA for elderly

mpc Calculate derived model parameters and do edits

**GIS** CT GIS take-up rate: pensioner couple by benefit level [benefit,rate]

#### DESCRIPTION

Probability by GIS benefit level group of a married two OAS pensioner family applying for the Guaranteed Income Supplement. These probabilities are applied only when the parameter GISTURFLAG is set to 1.

### **GISFLAG** Federal GIS/SPA/ESPA flag

## **DESCRIPTION**

When this parameter is assigned a value of 1, the GIS function is executed and Federal Guaranteed Income Supplement (imigis), Spouses Allowance and Extended Spouses Allowance (imispa) are calculated. With a value of 0, they are not. This parameter will automatically be set to 0 if the OASFLAG parameter is not set to 1.

## **GISOASFLAG** 1984 GIS top-up to OAS residence shortfall flag

### **DESCRIPTION**

When GISOASFLAG is set to one the maximum GIS benefit for recipients of partial OAS will be increased by the difference between actual and maximum OAS benefits. This corresponds to the change in the OAS/GIS system of October 1984. (Note: While the meaning of this parameter has not changed the detailed description of it was left out of the

**GISPTDFLAG** GIS income: Payroll tax deduction flag

#### DESCRIPTION

When GISPTDFLAG is set to one the income used to income test GIS benefits will not have payroll taxes (imcqppc, imuic) or allowable employment expenses (idalexp) deducted from income. When this parameter is set to zero these quantities will be subtracted from other

sources of income prior to the calculation of GIS benefits.

This parameter was introduced to model the initiative of the 1998 Federal budget to make the definition of income more consistent between programs such as the child tax benefit. The proposed changes were later withdrawn.

## **GISTFLAG** Provincial GIS top-up flag

### **DESCRIPTION**

When this parameter is assigned a value of 1, the six Provincial GIS Supplementation programs are activated. With a value of 0, they are not. This parameter will automatically be set to 0 (in mpc.c) if the GISFLAG parameter is set to 0.

**GSTCTUNC** GST credit take up by number of children

### **DESCRIPTION**

This is a take-up rate for the GST Credit based on the number of eligible children in the family. A take up of 1.000 denotes that all eligible recipients (based on family net income) would still receive the credit. A value less than 1.000 would result in only that proportion still getting the credit and the remainder would not. The first column denotes the number of eligible children in the family where 3 represent 3 or more children. The second column represents the proportion that will receive the credit.

When HEATRLFLG is turned on, persons will receive a transfer from the federal government for the relief of heating expenses (imheatrl). In order to receive it, a person has to have received a GST credit (imfstc). Qualifying persons who live with a spouse or children receive HEATFAM and others receive HEATSNG.

Note that, as indicated in the federal economic statement 2000, in order to receive a check in 2001 a person had to qualify for the GST credit in January 2001 or June 2000. In the SPSM this is the modeled GST credit for 2000 (we assume that the entire check is given in June), based on 1999 income. In order to simplify the code, we used receipt of the 2001 GST credit as a proxy for receipt of the 2000 GST credit. Given the fact that there were no change in rules governing the GST credit in these two years, this should have a small effect.

**IEMPADJ** Adjustment Factor: Employment income [employment income breaks,province]

### **DESCRIPTION**

This parameter adjusts Employment Income (idiemp) to represent administrative values in the data base year. The value for the parameter remains constant for all model years and is applied prior to GFIEMP. This is a two dimensional parameter indexed by employment income breakpoints (IEMPBRK) and province (hdprov).

This parameter should be set to 1 when outputting data in order to build a new database (bldspd). Otherwise the parameter will be applied twice.

**IEMPBRK** Adjustment Factor: Income breaks for income adjustment[employment income breaks]

### **DESCRIPTION**

This Vector determines the employment income breakpoints to be used in the growth of idiemp using IEMPADJ.

CPP/QPP benefits are under-reported on the SCF, as compared to administrative data. In the process of SPSD creation, a statistical method of correcting this problem has been made. This option has been provided to select between using this correction [default] or to disable CPP/QPP imputation altogether.

**IMPINTOPT** Imputation method, Interest [1=none 2=imputed]

#### DESCRIPTION

Interest income is under-reported on the SCF, as compared to administrative data. In the process of SPSD creation, a statistical method of correcting this problem was made. This option has been provided to select this method, or to disable interest income imputation altogether if desired.

**IMPSAOPT** Imputation method, SA [1=none 2=rank]

#### DESCRIPTION

Social assistance benefits are under-reported on the SCF, as compared to administrative data. In the process of SPSD creation, a statistical method of correcting this problem has been made. This option has been provided to select between using this correction [default] or to disable social assistance imputation altogether.

**IMPUIBOPT** Imputation method, UI [1=none 2=rank]

### **DESCRIPTION**

UI benefits are under-reported on the SCF, as compared to administrative data. In the process of SPSD creation, two distinct statistical methods of correcting this problem were made. This option has been provided to select between these two methods, or to disable UI imputation altogether if desired.

When this parameter is set to 1, imputation of provincial paid rents and property taxes are calculated based on Greenbook data, when set to .2 they are based on FAMEX data.

This control parameter is a vector of values used to provide the income cutpoints which define the columns of the hard-wired Tables 2 and 2A. Tables 2 and 2A can be activated using T2FLAG and T2AFLAG.

**INCVAR** 

Variable to use for table 2 [string]

#### DESCRIPTION

This string control parameter specifies the variable (usually an income variable) that is used to determine the column dimension of tables 2, 2A, 4, and 4A. Please see the <u>User's Guide</u> for more information.

The default value for INCVAR is _immicons.

### **INEQFLAG** Inequality measures facility activation flag

### **DESCRIPTION**

This parameter activates the calculation of inequality measures. Up to 10 different inequality measures can be produced.

The underlying function used to produce the measures is developed by Duclos, Jean-Yves and Martin, Tabi (1996), "Linear Inequality Measures and the Redistribution of Income", Cahier de recherche 96-08, CRÉFA, Université Laval. It is a two parameter class of linear inequality measure, the Generalized GINI. If v is the social preference and q produce symmetric weights around its value, for 0<q<1 then the weights k(p) are:

$$k(p) = \frac{v(v+1) |q-p|^{(v-1)}}{q^{(v+1)} + (v+q)(1-q)^{v}},$$

Those weights are applied to the difference between an equal cumulative income distribution and the actual cumulative income distribution for p, the cumulative population distribution.

The interesting aspect of this measure is its ability to reproduce the GINI when v is set to 1, the S-GINI index when q is set to 1.

In this measure, all the weights are symmetric around q. When v is lower than one, the weights structure is more like a pyramid centered at q, and is a V or U shape centered at q when v is greater than one. For more information, see the <u>User's Guide</u>.

**INEQMEASURE** Type of inequality measure [social preference, center of weight distribution]

#### **DESCRIPTION**

The calculation of an Inequality Measure is activated by setting INEQFLAG to 1.

The underlying function used to produce the measures is developed by Duclos, Jean-Yves and Martin, Tabi (1996), "Linear Inequality Measures and the Redistribution of Income", Cahier de recherche 96-08, CRÉFA, Université Laval. It is a two parameters class of linear inequality measures, the Generalized GINI. If v is the social preference and q produce symmetric weights around its value, for 0<q<1 then the weights k(p) are:

$$k(p) = \frac{v (v+1) |q-p|^{(v-1)}}{q^{(v+1)} + (v+q)(1-q)^{v}},$$

Those weights are applied to the difference between an equal cumulative income distribution and the actual cumulative income distribution for p, the cumulative population distribution.

The interesting aspect of this measure is its ability to reproduce the GINI when v is set to 1, the S-GINI index when q is set to 1.

In this measure, all the weights are symmetric around q. When v is lower than one, the weights structure is more like a pyramid centered at q, and is a V or U shape centered at q when v is greater than one.

Up to 10 different inequality measures can be computed with INEQMEASURE. The first parameter is v, the second q. As a special case when q is set to 99.0 the inequality measure is centered at the population share of the median income.

For more information, see the <u>User's Guide</u>.

**INPAPR** Name of database adjustment parameter file (in) [string]

#### **DESCRIPTION**

This control parameter gives the name of the file (using the conventions of the host operating system) which contains the database adjustment parameters to be used when executing

SPSM. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

### **INPBASMPR** Name of base tax/transfer parameter file (in) [string]

#### **DESCRIPTION**

This control parameter gives the name of the file (using the conventions of the host operating system) which contains the tax/transfer parameters to be used to produce base result variables. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory. BASMETH must be either 2 or 3 for INPBASMPR to have any effect.

### **INPBASMRS** Name of base results file (in) [string]

#### DESCRIPTION

The value of this control parameter is a binary SPSD/M results file filename. If the full path name of the file is omitted, the path will default to the current directory. When the value of BASMETH is set to 1, this file is used for determining base results.

**INPFXV** Name of FAMEX vector file (in) [string]

#### DESCRIPTION

This control parameter gives the name of the file (using the conventions of the host operating system) which contains the FAMEX expenditure vector binary database. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

**INPMRSVARS** Base results file variables [string]

#### DESCRIPTION

The value of this control parameter is generated during an SPSM program run. The parameter is set to a string of variable names of variables found in the input base results file specified in INPBASMRS. The user is not able to edit this parameter interactively in the SPSM dialogue.

This control parameter gives the name of the file (using the conventions of the host operating system) which contains the household and individual binary database to be used as an input reference file when executing SPSM. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

**INPSPD** 

Name of SPSD file (in) [string]

#### DESCRIPTION

This control parameter gives the name of the file (using the conventions of the host operating system) which contains the household and individual binary database to be used when executing SPSM. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

**INPVARMPR** Name of variant tax/transfer parameter file (in) [string]

#### DESCRIPTION

This control parameter gives the name of the file (using the conventions of the host operating system) which contains the tax/transfer parameters to be used to produce variant result variables. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

**INPWGT** 

Name of weight file (in) [string]

### **DESCRIPTION**

This control parameter gives the name of the file (using the conventions of the host operating system) which contains the household weight binary database to be used when executing SPSM. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

Certain expenditure items (sale of cars and RV's) are permitted to be negative expenditures on the FAMEX database. For commodity tax modeling purposes these expenditures must be treated as receipts. This adjustment parameter controls the treatment of negative expenditure items on the FAMEX database. With a value of zero Negative expenditures are treated as income in the calculation of commodity taxes. For Tax/Transfer simulations the setting must be zero. With a value of 1 the user can recover the original FAMEX data for output or tabulation.

**LICENSEE** SPSD/M licensee [string]

#### DESCRIPTION

This control parameter is produced by SPSM and contains the name of the person or organization licensed to use this particular copy of SPSD/M.

LOGFLAG Produce a .log file for this run

#### DESCRIPTION

The LOGFLAG parameter allows the user to control whether or not a log file of the SPSM run will be written. If LOGFLAG is 1, a file recording all the output normally displayed on the screen in the console version is written to the file specified by the OUTLOG parameter. If LOGFLAG is 0, no such file is written. The LOGFLAG parameter is particularly useful in the Windows version of SPSM, since it allows later examination of the details of the simulation run. It is also useful for documentation of any SPSM run.

The default value for LOGFLAG is 0.

**MAMTOPT** Man. alternative minimum tax option (1=none, 2=% fed, 3=fed adjusted net income)

#### DESCRIPTION

When Manitoba tax on taxable income is calculated (MTXFLG = 1), there are three options

as to how to calculate the provincial minimum tax.

When MAMTOPT is set to 1, then no provincial alternative minimum tax is calculated.

When MAMTOPT is set to 2, then a percentage (MAMTPCTF) of the additional federal tax due to the minimum tax is added to the basic provincial tax (imbpt).

When MAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the MAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

# MANCNPF Manitoba GIS supplement reduction point: married

## **DESCRIPTION**

The level of previous year combined annual income above which the Manitoba Supplement for Pensioners (MSP) begins to be paid at a reduced rate to eligible married persons who are non-GIS/SPA pensioners age 55 and over. Calculated as the arithmetic average of the 1983 reduction point and the 1985 reduction point for runs with the TARGETYEAR 1984.

### **MANLTCF** Manitoba learning tax credit factor

## **DESCRIPTION**

This is the Manitoba Learning Tax Credit factor. In order to calculate the Manitoba Learning Tax Credit, this factor is multiplied to the education and tuition tax credits (imedtxc and imtutxc) minus the education credits transferred to parents or spouse (imedtrf) plus the education credits transferred from children or spouse (imedrcv).

### MANLTMAX Manitoba learning tax credit maximum amount per student

### **DESCRIPTION**

This represents the maximum amount of education costs (tuition and education) per student which can be used to derive the Manitoba Learning Tax Credit. In order to calculate the Manitoba Learning Tax Credit, a factor (MANLTCF) is multiplied to the education and tuition tax credits (imedtxc and imtutxc) minus the education credits transferred to parents or spouse (imedtrf) plus the education credits transferred from children or spouse (imedrcv).

**MARAMT** Amount to be added to variable for marginal calculation

### **DESCRIPTION**

This control parameter gives the amount of money to be added to income when the marginal tax rate facility has been activated through MARFLAG. Please refer to the <u>User's Guide</u> for more information.

MARBASEFLAG Save marginal results as base run flag

### **DESCRIPTION**

This control parameter tells the SPSM marginal tax rate facility (activated using MARFLAG) to store additional information in the variables normally used to store base run results. If this parameter is 1, SPSM first checks to see that no base run has been requested (if a base run has been requested, an error message is produced). Then the marginal tax rate calculations are carried out normally, except that the results of the 'delta' run are saved as the 'base' results, allowing various calculations to be performed after the fact by the analyst interested in marginal tax rate analysis. Please refer to the *User's Guide* for more information.

This control parameter activates the SPSM marginal tax rate facility. This facility can be used to calculate marginal tax rates by income source, amount, recipient, and family level. Please refer to the *User's Guide* for more information.

MARSPEC

Expression identifying recipients [string]

#### DESCRIPTION

This control parameter allows the user to specify which individuals are to receive MARAMT when the marginal tax rate facility has been activated through MARFLAG. Please refer to the *User's Guide* for more information.

**MARVAR** 

Variable to add MARAMT to [string]

#### **DESCRIPTION**

This control parameter gives the income source to be incremented when the marginal tax rate facility has been activated through MARFLAG. It must be the name of a valid SPSD "id" income variable. Please refer to the <u>User's Guide</u> for more information.

**MAXDX** 

Maximum disability deduction/amount

#### DESCRIPTION

This value represents the maximum Disability Deduction and is given either as an exemption or credit (depending on the value of DISOPT) to all individuals with a positive value for imputed Disability Deduction (imdisex).

#### **MCGTCFLG** Man. Caregiver Tax Credit activation flag

#### **DESCRIPTION**

The calculation of the Manitoba Caregiver Tax Credit (impcgtc) is activated by the flag MCGTCFLG.

The Caregiver Tax Credit (impcgtc) provides additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is MCGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate MCGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate MCGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, impegte, is reduced for each dollar of net income, iminet, in excess of MCGTCTD.

This non-refundable tax credit is only calculated when the provincial tax on taxable income is calculated (MTXFLG = 1).

ba04.mpr:	1		Copied from ba03.mpr
ba05.mpr:	1		Copied from ba04.mpr

This is the first take-up rate used in the calculation of Manitoba's impogte. It selects an individual with idefrh = 3 and assign him/her as a parent according to observed probability in SCF. The probability is also based on idage.

The parameter is only used when the provincial tax on taxable income is calculated (MTXFLG=1).

**MEDREMIN** Minimum earnings for refundable medical expense supplement

#### **DESCRIPTION**

If earnings are less than this parameter, then a person is eligible to apply for the refundable medical expense supplement (immedref). Earnings are calculated as employment income (idiemp) plus self-employment income (idisenf + idisefm) minus registered pension plan deduction (idrpp) minus annual union, professional, or like dues (iddues) minus other

### **MHMASOPT** Manitoba homeowner assistance option (1=Model 2=database)

#### **DESCRIPTION**

When this parameter is set to 1, the Manitoba Homeowners Assistance (immhmas) is modelled. Any family with non-zero property taxes (improptx) is assumed to have had the minimum amount of assistance (MPMINC) taken off as a deduction from their municipal property tax statement.

When the option is set to 2, immhmas is set to the database variable (idhomstu).

**MNRDOPT** Manitoba tax reduction calculation option

#### **DESCRIPTION**

This parameter controls the calculation of the Manitoba Tax Reduction. With a value of 1, the tax reduction is calculated based on the Federal Tax Reduction and taxable income using MANRD. With a value of 2, it is calculated as a basic amount (MTRBR) reduced by a proportion (MTRF) of taxable income after allowing for an adjustment for the federal tax reduction transferred from spouse (see MTRSF). With a value of 3 it is calculated as an exemption, and as a tax credit with a value of 4.

### **DESCRIPTION**

This single parameter sets the tax credit rate for all of the non-refundable tax credits in Manitoba. Each tax credit is calculated separately and summed for a total credit. The parameter is only used when a provincial tax on taxable income is calculated (MTXFLG = 1).

### **CROSS REFERENCE**

**MPTC** Manitoba political contribution table [total donations,donation allowed]

#### **DESCRIPTION**

This table contains the figures necessary to calculate the Manitoba Political Contribution Tax Credit. The first column represents the dollar amount of total Manitoba political contributions to which the corresponding percentages of the third column are applied to calculate the total Allowable Manitoba Political Contribution Tax Credit. Only the first and third columns of the table need to be specified.

This table represents the Manitoba tax curve used when calculating the tax on taxable income (MTXFLG = 1). The first column represents Taxable Income, the second represents the amount of Basic Provincial Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

#### **MSCHBXM** Manitoba school tax basic amount

#### **DESCRIPTION**

This is the basic value of the Manitoba homeowners' school tax assistance. It is reduced by income over the turndown MSCHTD by a rate MSCHRR. The value of the benefit is also rounded (see MSCHRND). The benefit may not exceed school taxes paid (idmschpd) less the minimum threshold of MSCHMNTH. The school tax assistance is added to the basic property tax credit and applied against occupancy costs in order to derive the total property tax credit (impptxtc).

#### MSCHFLAG Manitoba school tax assistance activation flag

#### **DESCRIPTION**

The Manitoba homeowners' school tax assistance was implemented in 1993 and is part of the total property tax credit (impptxtc). MSCHFLAG turns it on or off. In order to qualify for assistance, Manitoba residents must be homeowners and be older than MSCHAGE. The basic credit is MSCHBXM which is reduced by income over the turndown MSCHTD by a rate MSCHRR. The value of the benefit is also rounded (see MSCHRND). The benefit may not exceed school taxes paid (idmschpd) less the minimum threshold of MSCHMNTH. The school tax assistance is added to the basic property tax credit and applied against occupancy costs in order to derive the total property tax credit (impptxtc).

**MSCHRND** Manitoba school tax assistance rounding unit

#### **DESCRIPTION**

This is the rounding factor of the Manitoba homeowners' school tax assistance. The basic credit MSCHBXM is reduced by income over the turndown MSCHTD by a rate MSCHRR. The value of the benefit is also rounded. The formula used is the following:

MSCHBXM – (MSCHRND * int((income – MSCHTD)*MSCHRR/MSCHRND))

The benefit may not exceed school taxes paid (idmschpd) less the minimum threshold of MSCHMNTH. The school tax assistance is added to the basic property tax credit and applied against occupancy costs in order to derive the total property tax credit (impptxtc).

**MTRBR** 

Manitoba tax reduction basic amount

## **DESCRIPTION**

This is the basic amount of the Manitoba Tax Reduction. Its actual definition depends on the method used to calculate the reduction. If MNRDOPT is set to 1, this parameter is not used. If MNRDOPT is set to 2, this amount is reduced by a proportion (MTRF) of taxable income.

MXMT Married exemption/amount turndown level

#### **DESCRIPTION**

The level of spousal net income above which the filer's married exemption begins to be reduced. The reduction is calculated as the dependant's net income less the turndown MXMT.

When the value of PEROPT is set to 1, this parameter is used in the calculation of immarex. When PEROPT is set to 2, this parameter is used in the calculation of immartxc.

**NAMTOPT** net income)

NFLD alternative minimum tax option (1=none, 2=% fed, 3=fed adjusted

#### **DESCRIPTION**

When Newfoundland tax on taxable income is calculated (NTXFLG = 1), there are three options as to how to calculate the provincial minimum tax.

When NAMTOPT is set to 1, then no provincial alternative minimum tax is calculated.

When NAMTOPT is set to 2, then a percentage (NAMTPCTF) of the additional federal tax due to the minimum tax is added to the basic provincial tax (imbpt).

When NAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the NAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

**NAXPI** NFLD Age Amount phase in rate for 1994 and beyond

# **DESCRIPTION**

This value is used to scale the amount of the reduction which will be applied to the provincial age tax credit. The parameter is only used when the Newfoundland provincial tax on taxable income is calculated (NTXFLG = 1).

See also impatxc, NAXM, NAXRR, and NAXTD.

<b>NBCBTD</b>	NB child b	enefits family incor	ne turndown

# **DESCRIPTION**

The level of family net income (head plus spouse) above which the New Brunswick Child Benefit begins to be paid at a lower rate. If family income exceeds this amount, the Child Benefit will be reduced by a proportion (NBCBRR) for families with two or more children or by (NBCBRRS) for families with one child.

New Brunswick Low-Income Seniors' Benefit

#### **DESCRIPTION**

**NBSB** 

This is the value of the Low-Income Seniors' Benefit. People who received the federal Guaranteed Income Supplement (GIS) are eligible to receive this benefit (imigist) for New Brunswick. When both spouses receive GIS, only one spouse may receive the Low-Income Seniors' Benefit. In the SPSD/M, the spouse with the lowest net income receives the benefit (or the oldest spouse when both spouses have the same net income).

**NCBFLG** Newfoundland child benefit activation flag

#### **DESCRIPTION**

This flag turns on or off the Newfoundland and Labrador Child Benefit. The Newfoundland and Labrador Child Benefit (imncb) is a tax-free monthly payment to help low-income families with the cost of raising children under age 18. Benefits from this program are combined with the Canada Child Tax Benefit into a single monthly payment. The program was implemented in July 1999.

Under the Newfoundland and Labrador Child Benefit program, you may be entitled to receive a benefit of NCB1 for the first child, NCB2 for the second child, NCB3 for the third child, and NCB4 for each additional child. The benefit is reduced when net family income is greater than NCBTD and is completely phased out when net family income is at least NCBPO.

**NCBTD** Nfld. child benefit family income turndown

#### **DESCRIPTION**

The level of family net income (head plus spouse) above which the Newfoundland and Labrador Child Benefit begins to be paid at a lower rate. The benefit is reduced when net family income is greater than this parameter and less than NCBPO.

# NCGTC NFLD Caregiver Tax Credit

### **DESCRIPTION**

NCGTC multiplied by NPNTCR is the maximum amount of the Newfoundland Caregiver Tax Credit (impcgtc). The parameter is only used when the provincial tax on taxable income is calculated (NTXFLG = 1).

For more explanation see NCGTCFLG.

#### **DESCRIPTION**

The calculation of the Newfoundland Caregiver Tax Credit (impcgtc) is activated by the flag NCGTCFLG.

The Caregiver Tax Credit (impcgtc) provides additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is NCGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate NCGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate NCGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, impcgtc, is reduced for each dollar of net income, iminet, in excess of NCGTCTD.

This non-refundable tax credit is only calculated when the provincial tax on taxable income is calculated (NTXFLG = 1).

**NCGTCTC** NFLD Caregiver tax credit take-up rate by age of elderly [age,rate]

#### **DESCRIPTION**

This is the first take-up rate used in the calculation of Newfoundland's impcgtc. It selects an individual with idefrh = 3 and assign him/her as a parent according to observed probability in SCF. The probability is also based on idage.

The parameter is only used when the provincial tax on taxable income is calculated (NTXFLG = 1).

		NONE=1.0000

### **DESCRIPTION**

When this parameter is assigned a value of 1, the Old Age Security clawback (imoasr) is netted from OAS (imioas). It thus appears as a lower transfer and lower tax – government and household balance variables are unaffected. With a value of 0, the OAS clawback is reported as a tax.

**NFSBBAS** NFLD Low-Income Seniors' Benefit base amount

### **DESCRIPTION**

This is the base value of the Newfoundland Low-Income Seniors' Benefit which was introduced in 1999. All seniors aged 65 and over, with annual family income less than NFSBTD are eligible to receive the maximum benefit NFSBBAS. This benefit will be reduced by NFSBRR for each dollar of family income over NFSBTD.

This table represents the Newfoundland tax curve used when calculating the tax on taxable income (NTXFLG = 1). The first column represents Taxable Income, the second represents the amount of Basic Provincial Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

**NSCI** Newfoundland provincial tax above which surtax applies

### **DESCRIPTION**

This is the level of provincial tax payable (imtxp) above which a surtax at the rate of NSF applies.

For Newfoundland, the SPSM calculates provincial surtax (impsur) as NSF percent of provincial taxes (imtxp) above the level NSCI.

### **CROSS REFERENCE**

**NSTCA** 

This parameter represents the basic Newfoundland Sales Tax Credit for adults. The total family sales tax credit (on behalf of the head, spouse and dependants) is reduced by a fraction (NSTCR) of family net income (head and spouse) exceeding the turndown level (NSTCL). This parameter is used only if NSTCFLAG is set to 1.

The level of family net income above which the total family Newfoundland Sales Tax Credit is reduced.

Note that non-taxable Social Assistance income may or may not be included in the calculation of net income for this reduction depending upon the status of CTCIFLAG. Social Assistance income includes federal and provincial Social Assistance, the Guaranteed Income Supplement, Spouses Allowance and income from Provincial GIS supplementation programs.

This parameter is used only if NSTCFLAG is set to 1.

OAMTOPT	Ont. alternative r	minimum tax	option (1=	none, 2	=% fed. 3=fe	d adiusted
			· F (-		,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,	
net income)						

When Ontario tax on taxable income is calculated (OTXFLG = 1), there are three options as to how to calculate the provincial minimum tax.

When OAMTOPT is set to 1, then no provincial alternative minimum tax is calculated.

When OAMTOPT is set to 2, then a percentage (OAMTPCTF) of the additional federal tax due to the minimum tax is added to the basic provincial tax (imbpt).

When OAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the OAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

#### **OAMTTX**

Ont. amt rate as tax on adjusted income

#### **DESCRIPTION**

When Ontario tax on taxable income is calculated (OTXFLG=1) and OAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the OAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

**OASRR** OAS reduction rate

#### **DESCRIPTION**

This parameter is available for testing the effects of repaying OAS benefits based on a proportion of net income. The OAS repayment is calculated as the lesser of OAS Benefits (imioas) and a proportion OASRR of family net income (head plus spouse) exceeding the reduction level OASTD. The calculated OAS repayment is added to imrepay, All Repayments. If OASRR is set to 0, no repayment is calculated.

OASTBPI	OAS take-back	phase in	

This parameter is used to scale the amount of the Old Age Security clawback which will be paid in additional taxes. The Old Age Security clawback was introduced in the 1989 budget. The purpose is to simulate the phase-in of the clawback.

**OCAPGIR** Ont. Capital Gains Inclusion Rate

### **DESCRIPTION**

The proportion of gross capital gains (idicapg) that are treated as taxable in Ontario.

When OCGIRFLG is activated (set to 1), the Ontario taxable income for the purpose of Ontario taxes is reduced by amount of gross capital gains times the difference in the federal capital gains inclusion rate (CAPGIR) and the Ontario capital gains inclusion rate. (idicapg * (CAPGIR – OCAPGIR). The resulting value for the taxable income is imiotax. This is only used when OTXFLG is set to 1.

The Ontario Capital Gains Inclusion Rate was announced in the Ontario 2000 Budget to be implemented in 2001. However, legislation regarding the actual implementation was not complete at the time of this release.

OCCEAFLG Ont. Child Care Expense Credit activation flag

### **DESCRIPTION**

The activation flag of the Ontario refundable child care expense tax credit (imoccea). The calculation is activated when the value is set to 1, no calculation if the value is zero. This program was revised and superceded by the Ontario Child Care Supplement for Working Families introduced in the Ontario Budget of May 1998.

**OCCEATD** Ont. Child Care Expense Credit family income turndown

### **DESCRIPTION**

The level of family net income (head plus spouse) above which the refundable Ontario child care expense tax credit (imoccea) begins to be paid at a lower rate. If family income exceeds this amount, the maximum family benefit will be reduced by a proportion (OCCEARR) of net income.

## **OCGIRFLG** Ont. Capital Gains Inclusion Rate Activation Flag

#### DESCRIPTION

When this flag is activated (set to 1), the Ontario taxable income for the purpose of Ontario taxes is reduced by amount of gross capital gains times the difference in the federal capital gains inclusion rate (CAPGIR) and the Ontario capital gains inclusion rate. (idicapg * (CAPGIR – OCAPGIR). The resulting value for the taxable income is imiotax. This is only used when OTXFLG is set to 1.

The Ontario Capital Gains Inclusion Rate was announced in the Ontario 2000 Budget to be implemented in 2001. However, legislation regarding the actual implementation was not complete at the time of this release.

#### **OCGTCFLG** Ont. Caregiver Tax Credit activation flag

#### **DESCRIPTION**

The calculation of the Ontario Caregiver Tax Credit (impcgtc) is activated by the flag OCGTCFLG.

The Caregiver Tax Credit (impcgtc) provides additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is OCGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate OCGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate OCGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, impcgtc, is reduced for each dollar of net income, iminet, in excess of OCGTCTD.

This non-refundable tax credit is only calculated when the provincial tax on taxable income is calculated (OTXFLG = 1).

**OCGTCTC** Ont. Caregiver tax credit take-up rate by age of elderly [age,rate]

### **DESCRIPTION**

This is the first take-up rate used in the calculation of Ontario's impcgtc. It selects an individual with idefrh = 3 and assign him/her as a parent according to observed probability in SCF. The probability is also based on idage.

The parameter is only used when the provincial tax on taxable income is calculated (OTXFLG=1).

**OCWISFLG** Ont. Child Care Working Income Supplement activation flag

### **DESCRIPTION**

This parameter controls the activation of the Ontario Child Care Supplement for Working Families introduced in the Ontario Budget of May 1998. When set to 1 benefits under this

program will be calculated. The Ontario Budget of May 2000 announced a higher annual maximum for single parents of OCWISSP.

#### **DESCRIPTION**

For families with earnings from work, this parameter is used to calculate the maximum Ontario Child Care Supplement for Working Families. The parameter represents the benefit rate as a proportion which is applied to family earnings above the threshold OCWISTD. This lookup parameter is indexed by the number of children under the age of 7 in the census family.

**OCWISTD** Ont. Child Care Working Income Supplement minimum earnings

### **DESCRIPTION**

For families with earnings from work, this parameter is used in the calculation of the maximum Ontario Child Care Supplement for Working Families. The parameter represents the threshold of family earnings above which maximum benefits are calculated as a proportion (OCWISRR) of family earnings up to a ceiling of OCCEAYNG times the number of children under the age of 7 in the census family.

#### **OEHTRR1** OEHT - Rate 1

#### DESCRIPTION

This is the first tax rate for the Ontario Employer Health Tax. When a person's income from self-employment is less than OEHTTD1, the Employer Health Tax is calculated as the rate times any self-employment earnings greater than the exemption OEHTEX.

The Ontario Employer Health Tax is only calculated when OEHTFLAG is equal to 1. The Tax is then reduced by a tax deduction calculated using OEHTDRR.

This is the second rate for the Ontario Employer Health Tax. When a person's income from self-employment is less than OEHTTD2, but greater than OEHTTD1, the Employer Health Tax is calculated by adding OEHTRR1 times the difference between the first turndown (OEHTTD1) and the exemption rate (OEHTEX) and OEHTRR2 times the difference between earnings from self-employment and OEHTTD1.

The Ontario Employer Health Tax is only calculated when OEHTFLAG is equal to 1. The Tax is then reduced by a tax deduction calculated using OEHTDRR.

**OPNTCR** Ont. provincial non-refundable tax credit rate

### **DESCRIPTION**

This single parameter sets the tax credit rate for all of the non-refundable tax credits in Ontario. Each tax credit is calculated separately and summed for a total credit. The parameter is only used when a provincial tax on taxable income is calculated (OTXFLG = 1).

#### **DESCRIPTION**

This table contains the figures necessary to calculate the Ontario Political Contribution Tax Credit. The first column represents the dollar amount of total Ontario political contributions to which the corresponding percentages of the third column are applied to calculate the total Allowable Ontario Political Contribution Tax Credit. Only the first and third columns of the table need to be specified.

This table represents the Ontario tax curve used when calculating the tax on taxable income (OTXFLG=1). The first column represents Taxable Income, the second represents the amount of Basic Provincial Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

Ont. tax table [taxable income,basic provincial tax]

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

#### **OPYTAX** Estimate of previous year's Ontario taxes

#### **DESCRIPTION**

This parameter estimates the previous year's taxes. The taxpayer dividend (imotxdv) is equal to taxes paid in the previous year up to a maximum (OTXDVMAX). People who paid over 0\$ in taxes would get a minimum rebate of OTXDVMIN. The benefit is included in refundable tax credits. Since it is based on the previous year's taxes, the taxes are multiplied by OPYTAX in order to estimate the lagged effect.

#### **ORDOPT**

Ontario tax reduction calculation option

#### **DESCRIPTION**

If ORDOPT has a value of 1 then the Ontario Tax reduction is calculated based on taxable income; with a value of 2 it is calculated based on Ontario Tax; with a value of 3 it is based on Ontario Tax as well as the number of dependants. The switch in calculation method from taxable income to Ontario tax occurred in 1988 and then expanded to include dependants in 1990.

**OSSML** 

Ontario surtax first cut-in level

## **DESCRIPTION**

The amount of Ontario Provincial Income Tax above which the surtax rate (OSSMR) is applied. In 1984, the Ontario Social Services Maintenance Tax is simulated using this rate. This parameter is also used, where appropriate, to simulate the Ontario Fair Share Health Care Levy which is a basic surtax calculation.

#### **DESCRIPTION**

OSSMR2

The rate which is applied to Provincial Income Tax ( imtxp ) exceeding OSSML2 to calculate the Ontario surtax. The total rate of surtax above the second tier cut-in OSSML2 would be the sum of this parameter and OSSMR.

Ontario surtax second level rate

For Ontario, the SPSM calculates provincial surtax (impsur) as OSSMR percent of provincial taxes (imtxp) above the level OSSML plus OSSMR2 percent of provincial taxes above the level OSSML2.

This parameter is used, where appropriate, to simulate the Ontario Fair Share Health Care Levy which is a basic surtax calculation.

# OTXDVMAX Maximum taxpayer dividend

# **DESCRIPTION**

The taxpayer dividend (imotxdv) is equal to taxes paid in the previous year up to a maximum

(OTXDVMAX). People who paid over 0\$ in taxes would get a minimum rebate of OTXDVMIN. The benefit is included in refundable tax credits. Since it is based on the previous year's taxes, the taxes are multiplied by OPYTAX in order to estimate the lagged effect.

**OUTAPR** 

Name of database adjustment parameter file (out) [string]

#### DESCRIPTION

This control parameter gives the name of the file (using the conventions of the host operating system) which will contain the database adjustment parameters which were used to adjust SPSD variables. SPSM writes out such a file only if the user changed one or more database adjustment parameters from the values in the corresponding input file INPAPR. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

**OUTASC** Name of text output file (out) [string]

#### **DESCRIPTION**

This control parameter gives the name of the file (using the conventions of the host operating system) which will contain the output report generated by the text output facility. The text output facility must be activated using ASCFLAG for OUTASC to have any effect. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

**OUTCPR** Name of control parameter file (out) [string]

#### DESCRIPTION

This control parameter gives the name of the file (using the conventions of the host operating system) which will contain the output control parameter file. An output control parameter file is always created, and includes any changes the user made to the input control parameter file. In addition, certain "read-only" parameters which are created by SPSM for informational purposes may have changed values. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

The OUTLOG parameter gives the name of the output file that will contain a log of the SPSM run, provided that this facility has been activated using the LOGFLAG parameter. See the description of the LOGFLAG parameter for more information. A default value for OUTLOG will be generated by adding an extension of .log to the SPSM run name, but can be overridden.

### **OUTMRSFLAG** Variant results file creation flag

#### DESCRIPTION

If the value of the control parameter OUTMRSFLAG is set to 1, a results file (with name given by OUTVARMRS) will be created containing variant results for variables specified in OUTMRSVARS. Results are always saved at the individual (not family or household) level.

### **OUTMRSFRAC** Variant results file preserves fractional part

#### **DESCRIPTION**

This control parameter can be used to preserve the fractional part (if present) of all variables written to the model results (MRS) file. If this flag is off, all output values are converted to integers before being written to the results file. If this flag is turned on, the fractional part of the output variables will be retained, and there will be no differences between base MRS variables and modelled variables for an identical run. This flag may result in a significant increase in the size of the model results file.

### **OUTMRSVARS** Variant results file variables [string]

#### DESCRIPTION

This control parameter contains a list of tax/transfer calculated variables whose variant values will be recorded in the file named OUTVARMRS if the variant results file facility has been activated by OUTMRSFLAG. Only variant tax/transfer variables (that is, those that begin with "ct" or "im") or user variables can be recorded in a results file.

If the SAS results file facility has been activated using SASFLAG, then the control parameter OUTSAS contains the name of the resulting SAS file. Because SAS files contain an encrypted header structure, SPSM must use the header of an identically-named existing SAS file to create a new SAS file named OUTSAS. The existing SAS file must have been created using the 6.03 library engine. If such file does not exist, SPSD/M will create "spsmtemp.ssd" because SPSD/M already know how to create such file. The user can then change "spsmtemp.ssd" to some other name if desired by using the PROC DATASETS procedure in SAS. Because SAS native files contain a generated key in their header, SPSM can only write over existing SAS files (using the existing generated key in their header), or else produce a file with the name "spsmtemp.ssd", whose header key is already known.

An associated file, with the same stem as OUTSAS but with extension ".sfm", is also produced when the SAS output facility is activated. It is a text file which contains SAS source code (PROC FORMAT and associated statements) which will define the formats for any class variables given in SASVARS. It (or equivalent statements) should be included in any SAS job which reads the SAS file named by OUTSAS.

See User's Guide, SAS Output Facility.

**OUTTBL** Name of report file (out) [string]

#### DESCRIPTION

This control parameter gives the name of the file (using the conventions of the host operating system) which will contain all summary reports generated by SPSM output facilities, including the cross tabulation facility and distributional analysis facility. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

**OUTVARMPR** Name of variant tax/transfer parameter file (out) [string]

#### DESCRIPTION

This control parameter gives the name of the file (using the conventions of the host operating system) which will contain the output variant tax/transfer parameters. SPSM writes out such a file only if the user changed one or more variant tax/transfer parameters from the values in the corresponding input file INPVARMPR. Note that under MS-DOS, names without a

drive specifier or any slashes refer to the current directory.

### **OUTVARMRS** Name of variant results file (out) [string]

#### **DESCRIPTION**

This control parameter gives the name of the file (using the conventions of the host operating system) which will contain the output variant results. Such a file is generated only if the user activates the variant result file facility using OUTMRSFLAG. Note that under MS-DOS, names without a drive specifier or any slashes refer to the current directory.

**OYPNDL** Ont. Pension Income Deduction Amount

#### DESCRIPTION

This is the maximum dollar amount of pension income which may be claimed as an Ontario non-refundable tax credit. The parameter is only used when the provincial tax on taxable income is calculated (OTXFLG = 1).

**PAMTOPT** net income)

P.E.I. alternative minimum tax option (1=none, 2=% fed, 3=fed adjusted

# DESCRIPTION

When Prince Edward Island tax on taxable income is calculated (PTXFLG = 1), there are three options as to how to calculate the provincial minimum tax.

When PAMTOPT is set to 1, then no provincial alternative minimum tax is calculated.

When PAMTOPT is set to 2, then a percentage (PAMTPCTF) of the additional federal tax due to the minimum tax is added to the basic provincial tax (imbpt).

When PAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the PAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

### **PAXM** P.E.I. Age Amount

#### **DESCRIPTION**

This is the maximum value of the Prince Edward Island age non-refundable tax credit before any reductions are applied. The parameter is only used when a provincial tax on taxable income is calculated (PTXFLG = 1).

### **PCGTCFLG** P.E.I. Caregiver Tax Credit activation flag

#### DESCRIPTION

The calculation of the Prince Edward Island Caregiver Tax Credit (impcgtc) is activated by the flag PCGTCFLG.

The Caregiver Tax Credit (impcgtc) provides additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is PCGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate PCGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate PCGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, impcgtc, is reduced for each dollar of net income, iminet, in excess of PCGTCTD.

This non-refundable tax credit is only calculated when the provincial tax on taxable income is calculated (PTXFLG = 1).

ba04.mpr:	1		Copied	from ba03.mpr
ba05.mpr:	1		Copied	from ba04.mpr

This is the first take-up rate used in the calculation of Prince Edward Island's impost. It selects an individual with idefrh = 3 and assign him/her as a parent according to observed probability in SCF. The probability is also based on idage.

The parameter is only used when the provincial tax on taxable income is calculated (PTXFLG=1).

# PMXMT P.E.I. married amount turndown level

### **DESCRIPTION**

This parameter represents the provincial married exemption turndown when Prince Edward Island tax is calculated as a tax on taxable income. It is only used when PTXFLG is set to 1. The reduction is calculated as the dependant's net income less the turndown PMXMT.

### **DESCRIPTION**

This single parameter sets the tax credit rate for all of the non-refundable tax credits in Prince Edward Island. Each tax credit is calculated separately and summed for a total credit. The parameter is only used when a provincial tax on taxable income is calculated (PTXFLG = 1).

**PPTX** P.E.I. tax table [taxable income,basic provincial tax]

### **DESCRIPTION**

This table represents the Prince Edward Island tax curve used when calculating the tax on taxable income (PTXFLG = 1). The first column represents Taxable Income, the second represents the amount of Basic Provincial Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

# **PRDFFLAG** Parameter difference report activation flag

# **DESCRIPTION**

When this control parameter is set to 1, a report is written to the file given by OUTTBL. This report shows tax/transfer parameter differences between base and variant. A more

sophisticated parameter difference report can be obtained by using the compparm utility, which is documented in the *Tools User's Guide*.

### **PROVMAP** Provincial remapping [prov]

### **DESCRIPTION**

Provincial remapping facility to enable the reassignment of province codes. This could be used to assign to one or more provinces another province's tax transfer system.

**PSCI** 

P.E.I. provincial tax above which surtax applies

### **DESCRIPTION**

Provincial surtax in Prince Edward Island is calculated as PSF percent of provincial tax in excess of PSCI.

**PTF** Low income cut-off [size, urban]

#### DESCRIPTION

This parameter, defined in the database adjustment parameter file, is a two dimensional array giving a user-supplied "income threshold" for families by number of persons and urban area, thus allowing the use of Statistics Canada Low Income Cut-offs in SPSM. The ratio of family income to the "income threshold" is used, in conjunction with the PVRAT control parameter, to create the column categories for the hard-wired tables 4 and 4A. These tables must have been activated using T4FLAG or T4AFLAG for this parameter to be used. Please see the <u>User's Guide</u> for more information on the hard-wired tables.

**PTRBAS** Base PEI low income tax reduction

#### DESCRIPTION

This is the base amount for the Prince Edward Island Low income tax reduction.

Announced in the 2000 budget, the maximum Low Income Tax Reduction is equal to the sum of a base amount (PTRBAS), an amount for a spouse or equivalent-to-spouse (PTRSP), and an amount for each dependent child (PTRKID). It is then reduced for net income over PTRTD at a rate of PTRRR. The reduction cannot be more than taxes owing. The reduction is calculated at a family level but can be split amongst spouses.

PTRKID	PEI low in	come tax reduction for dependent child

#### **DESCRIPTION**

This is the amount for dependent children for the Prince Edward Island Low income tax reduction.

Announced in the 2000 budget, the maximum Low Income Tax Reduction is equal to the sum of a base amount (PTRBAS), an amount for a spouse or equivalent-to-spouse (PTRSP), and an amount for each dependent child (PTRKID). It is then reduced for net income over

PTRTD at a rate of PTRRR. The reduction cannot be more than taxes owing. The reduction is calculated at a family level but can be split amongst spouses.

#### **DESCRIPTION**

This is the reduction rate for the Prince Edward Island Low income tax reduction.

Announced in the 2000 budget, the maximum Low Income Tax Reduction is equal to the sum of a base amount (PTRBAS), an amount for a spouse or equivalent-to-spouse (PTRSP), and an amount for each dependent child (PTRKID). It is then reduced for net income over PTRTD at a rate of PTRRR. The reduction cannot be more than taxes owing. The reduction is calculated at a family level but can be split amongst spouses.

**PTRSP** PEI low income tax reduction for spouse or equivalent-to-spouse

#### **DESCRIPTION**

This is the married or equivalent-to-married amount for the Prince Edward Island Low income tax reduction.

Announced in the 2000 budget, the maximum Low Income Tax Reduction is equal to the sum of a base amount (PTRBAS), an amount for a spouse or equivalent-to-spouse (PTRSP), and an amount for each dependent child (PTRKID). It is then reduced for net income over PTRTD at a rate of PTRRR. The reduction cannot be more than taxes owing. The reduction is calculated at a family level but can be split amongst spouses.

PURB	Base yea	ar unemployment rate	[prov]	

# **DESCRIPTION**

This parameter is the base year unemployment rate by province.

#### **DESCRIPTION**

This parameter is the current year unemployment rate by province.

**PURR** 

Ratio current:base unemployment rate [prov]

#### **DESCRIPTION**

The parameter is the ratio of PURC over PURB.

**PVRAT** 

Family poverty ratio fractions for table 4 [array]

#### **DESCRIPTION**

This control parameter is a vector which defines the ranges of family-specific income threshold ratios to be used when producing the hard-wired tables 4 or 4A. Please see the *User's Guide* for more information on the hard-wired tables.

**PYINC** 

Deflator to calculate previous year income

#### DESCRIPTION

CPI deflator applied to income to obtain estimate of the previous year's income for needs tested programs. Calculated using the CPI, Canada, All Items annual average January-December. The CPI for the previous year is divided by the CPI for the current year.

The Quebec Availability allowance is paid as a supplement to Quebec family allowances starting in 1989. This vector parameter has three elements corresponding to the sequential position in the family of each child. The value of each element represents the dollar value of the benefits. The parameter is effective only when QAAFAFLAG is set to 1.

Starting in 1998, the program is replaced by the Quebec Family Allowance Tax Credit which is activated when QFATCOPT is set to 2.

For more details see QFATCOPT.

## QAAFAFLAG Availability Allowance: Supplement to Quebec FA

#### **DESCRIPTION**

The Quebec Availability allowance is paid as a supplement to Quebec family allowances starting in 1989. When QAAFAFLAG is set to one the Quebec Availability allowance will be paid as a supplement to provincial family allowances using amounts specified in the QAAFA parameter.

Starting in 1998, the program is replaced by the Quebec Family Allowance Tax Credit which is activated when QFATCOPT is set to 2.

For more details see QFATCOPT.

## **QAARCFLAG** Availability Allowance: Refundable Tax Credit

## **DESCRIPTION**

The Quebec Availability allowance is paid as a refundable tax credit for years prior to 1988. When QAARCFLAG is set to one the Quebec Availability allowance will be paid as refundable tax credit using amounts specified in the QAARC parameter.

Starting in 1998, the program is replaced by the Quebec Family Allowance Tax Credit which is activated when QFATCOPT is set to 2.

For more details see QFATCOPT.

**QAMTXFLG** Quebec alternative minimum tax, QAMTX, activation flag

The Alternative Minimum Tax in Quebec started in 1986 and is now fully implemented. The calculation is activated by QAMTXFLG. The calculation of the income considered is slightly different than the Federal Alternative Minimum Tax because of difference in the rates considered for:

the inclusion of an amount of capital in the income considered (QCAPAMTX),

. the dividing factor for the dividends (QDIVRAT), and

. the dividing factor for the capital gains (QCAPRAT).

The exemption level is QAMTX and the tax rate is QAMTTX. If the calculated value of the Alternative Minimum Tax is higher than the calculated tax using the standard algorithm, the difference is stored in imqamt. A flag, imqamtfg, identifies the individuals with the modified income tax. In 1995, the definition of income was changed and QAMTXREF indicates new

components used in the calculation of taxable income.

**QAXPI** Quebec age exemption reduction phase in

## **DESCRIPTION**

This value is used to scale the amount of the reduction which will be applied to the age tax credit. It is used in 1996 to simulate the phase-in of the income testing of the age credit.

Legislation relating to this parameter was introduced in the 1996 Quebec Budget which proposed that the non-refundable age tax credit "be subject to an income test which would target the assistance to seniors with low or modest incomes." This reduction for higher income seniors was to be phased in over two years, with half the reduction applied in 1996 and the full reduction in 1997 and subsequent years.

See also impaate, QAXM, QAXRR, and QAXTD.

This parameter is the proportion of net income above a given threshold (QAXTD) which will be deducted from the non-refundable age tax credit amount (QAXM).

Legislation relating to this parameter was introduced in the 1996 Quebec Budget which proposed that the non-refundable age tax credit "be subject to an income test which would target the assistance to seniors with low or modest incomes." Individual seniors with incomes above the threshold of \$26,000 would have the amount of the age credit reduced by 15% of income above that threshold. This reduction for higher income seniors was to be phased in over two years, with half the reduction applied in 1996 and the full reduction in 1997 and subsequent years.

QAXTD	Quebec age e	exemption income	e turn down

Individual seniors will have their non-refundable age tax credit reduced if their net income is above the value of this parameter.

Legislation relating to this parameter was introduced in the 1996 Provincial Budget which proposed that the non-refundable age tax credit "be subject to an income test which would target the assistance to seniors with low or modest incomes." Individual seniors with incomes above the threshold of \$26,000 would have the amount of the age credit reduced by 15% of income above that threshold. This reduction for higher income seniors was to be phased in over two years, with half the reduction applied in 1996 and the full reduction in 1997 and subsequent years.

In Quebec, the federal Child Tax Benefit programme entitlements are based on the number of children and the ages of children. This parameter represents the basic entitlement with respect to the first (eldest) child in the family.

#### **DESCRIPTION**

In Quebec, provisions for tax relief related to child care expenses have been calculated in two distinct ways; first as a deduction from total income or more recently as a refundable tax credit. When this parameter is set to 1, the Quebec child care expense deduction (imqccea) will be calculated. When it is set to 2 the refundable child care expense tax credit (imqccetc) will be calculated.

## **QCCETCR** Refundable CCE credit rate [net income, % cce claimable]

#### **DESCRIPTION**

This lookup table parameter provides the proportions of allowable child care expenses which may be claimed for the refundable child care expense tax credit (imqccetc). These proportions are determined by looking up the child care expense net income for the family (imqcceni) in the left most column and finding the appropriate proportion in the middle column.

**QEEXPDED** Quebec employment expenses deduction application flag

#### **DESCRIPTION**

This parameter denotes the application of employment expenses in the calculation of net income for Quebec provincial taxes. When this parameter is assigned to 1, the employment expenses are added to the total deductions (imqdedft). When this parameter is 0, the employment expenses are used to reduce the total income (imqitot). This represents a change to the Quebec Income Tax forms in 1998.

**QFAMDED** Quebec Family related deduction on income in refundable credits

## **DESCRIPTION**

When QFAMFLG is set to 0, persons who lived alone had this value used to reduce their income used for calculating the tax reduction for families (imqei) in order to calculate the real estate tax refund (imqptr) and the refundable QST credit (imqstr).

When QFAMFLG is set to 1, this is the amount which reduces net income in order to calculate the tax reduction for families (imqftr), the amount with respect to age, for a person living alone, or for retirement income (imqcalr), the real estate tax refund (imqptr) and the refundable QST credit (imqstr).

#### **DESCRIPTION**

The calculation of the family tax credit is modified in 1998. The new calculation is activated by the flag QFAMFLG. The family net income is reduced by the family deduction (the reduced family income), QFAMDED, that is increased to \$26,000. A first part of the family credit is associated to a person living alone or with one or more dependant children, QEIA3 and QEIA5, all others (QEIA1, QEIA2, QEIA4) are set to zero. The amount for elderly, QEIAA, and for retirement income remains. The value of the first part of the credit is then the difference between those credits and the reduced family income considered at a rate QFAMRAT.

The second part of the family tax credit remains the same for the family structure with dependant children, the rate applied to the reduced family income, QFTRRR, is increased from 4% to 6%.

See also QFAMRAT.

**QFAMNETI** Quebec family allowance tax credit net income concept flag

#### **DESCRIPTION**

This parameter defines the income definition to be used in the calculation of Quebec family allowance tax credit (imqfatc).

When assigned to 0, the income test is based on the net income of the individual and the net income of the spouse, if applicable. When assigned to 1, the net income is based on line 220 of the tax form and has the same calculation regardless of which form, general or simplified, was completed. The new concept of net income is calculated as total income less contributions paid to an RPP, contributions paid to an RRSP and contributions to CPP/QPP by self-employed workers, if applicable. Beginning in 1998, this is the net income concept to be used to determine net family income. The flag is set to 1 beginning in 1999, since the calculation for the Quebec family allowance tax credit is based on previous year's income.

# **QFATCHIRR** QFATC High income reduction rate

## **DESCRIPTION**

Under the Quebec Family Allowance Tax Credit, this parameter represents the income reduction rate to be applied to the calculated benefit when the family net income exceeds the high income turndown (QFATCHITD). This is valid only when QFATCOPT = 2.

# **QFATCHITD** QFATC High income turndown

#### **DESCRIPTION**

Under the Quebec Family Allowance Tax Credit (QFATCOPT=2), this parameter represents the high income turndown level. For families with net income over this amount, the Quebec Family Allowance Tax Credit is equal to the minimum benefit amount (depending on the number of children) less the difference between the family net income and this turndown amount multiplied by the applicable reduction rate (QFATCHIRR).

# **QFATCK6PYR** QFATC supplement for kids under 6 phase out year proportion

#### **DESCRIPTION**

Under the Quebec Family Allowance Tax Credit (QFATCOPT=2), an extra supplement was available for large families with children under the age of 6 who were also born before August 1, 1997. This parameter contains the proportion of the year that is before August 1. For each child in the family under the age of 6, their age is compared to the difference between TARGETYEAR and QFATCK6YR. If this difference is less than their age, they qualify as an eligible child. If the difference is equal to the child's age (meaning that their year of birth would be 1997), then a random number is compared to this parameter to determine if the child was born before August 1.

# **QFATCOPT** Quebec Family Allowance Tax Credit Option transfer=1, tax credit=2

#### **DESCRIPTION**

When set to 2 it activates the calculation of the Quebec Family Allowance Tax Credit. When set to 1 it activates the calculation of the Quebec family allowance, the Quebec new born allocation and the Quebec availability allowance.

The Quebec Family Allowance Tax Credit started in September 1997 – 1998 in the model. The Quebec Family Allowance Tax Credit is a credit based on previous year net family income and is non-taxable. The maximum credits vary with the number of children

(QFATCMXK), and a supplement QFATCSUP is allocated to single parent families. For families with 4 kids and more, a supplement, QFATCK6, is added that varies with the number of kids in the family and the number of kids under 6. The credit is maximum until it reaches the first turn down income level with a specific reduction rate. The sequence of turn down incomes and reduction rates for single parent families are in QFATCSRR and for married couples in QFATCMRR. The turning point at QFATD4K is increased by QFATD4KI for each child over three. The benefits are reduced up to a minimum based on the number of children in the family (QFATCMNK) until the net family income reaches the last turning point in either QFATCSRR or QFATCMRR. At this last turning point the benefits are starting to reduce until they reach a minimum for payments of QFATCMIN. The program is implemented by copying the reduction rate table (QFATCSRR or QFATCMRR) into a temporary table. Then another temporary table assigns benefits and reduction rates to turning point incomes. Finally, the calculated benefits, impfate, are assigned to the women in the married couples or to the head of the single parent family. A take-up rate, QFATCTK, selects the assigned individual only if a random number is higher than the level specified by its total income. As a standard, QFATCTK is set to zero and all individuals are selected.

QFFSL	Federal family allowance: Quebec Configuration[parity,\$]			

## **DESCRIPTION**

In federal family allowances are based on the number of children in the family. In the look-

up table, the first column represents the number of children, the second column is the cumulative amount and the third column represents the marginal amount per child.

# **QFPSL** Quebec provincial family allowance [parity,\$]

#### **DESCRIPTION**

In Quebec, the provincial portion of Family Allowances are also based on the number of children in the family. The table is used similarly to QFFSL.

Starting in 1998, the program is replaced by the Quebec Family Allowance Tax Credit which is activated when QFATCOPT is set to 2.

For more details see QFATCOPT.

**QFS** Federal supplement per child 12-17 in Quebec configuration

#### **DESCRIPTION**

In Quebec, the provincial government pays a Family Allowance Supplement of this amount on behalf of each child aged 12 to 17.

Starting in 1998, this program is replaced by the Quebec Family Allowance tax Credit and is activated when QFATCOPT is set to 2.

See QFATCOPT for more details.

**QGFTCR** Quebec credit rate for gifts over upper limit

### **DESCRIPTION**

This is the rate used to calculate the Quebec tax credit for gifts and charitable donations that exceed QGIFTL1 when QGIFTHCR is equal to 1. For gifts and charitable donations up to QGIFTL1, the Quebec nominal tax credit rate (QNTCR) is used.

See also QGIFTL1, QGIFTOPT, impchate and QNTCR.

## **QGIFTHCR** Quebec higher tax credit on large gifts activation flag

### **DESCRIPTION**

When this parameter is set to 1, large gifts are subject to a higher tax credit rate. Beginning in 2000, there are two tax credit rates applied to gifts in Quebec. Allowable gifts up to QGIFTL1 use the QNTCR. The higher credit rate QGFTCR is applied to allowable gifts over QGIFTL1. The total value of the tax credit is imperate.

See also: imqchara, imqchatc, QGIFTOPT, QGIFTFLG.

**QGIFTL1** Quebec minimum gift limit subject to higher credit rate

## **DESCRIPTION**

When QGIFTHCR is equal to 1, different tax credit rates are used depending on the size of the gift. The Quebec nominal tax credit rate (QNTCR) is used on the amount of gifts and charitable donations up to this limit. The tax credit rate for gifts and charitable donation above this amount will be QGFTCR.

See also QGFTCR, QGIFTOPT, impchate and QNTCR.

## **QGIFTOPT** Quebec gifts as tax credit

#### **DESCRIPTION**

When this parameter is set to 1, impchara is calculated as a deduction of net income. Starting in 1993, the parameter is set to 2, and charity and gifts, impchate, are now tax credit. When QGIFTFLG is set to zero, before 1998, gifts are not subject to a maximum. Starting in 1998, QGIFTFLG is set to 1 when charity and gifts were subject to the same maximum based on net income.

### QHPTCFLG Quebec Housing Parent Tax Credit activation flag

#### **DESCRIPTION**

The calculation of the Quebec Home Parent Tax Credit (imqhptc) is activated by the flag QHTCFLG. The refundable credit started in 1992. The level of refundable credit is based on the duration of parent or grandparent stay in the economic family. The base level of the credit is QHPTC. A take-up rate QHPTCTC based on age of the potential parent assigns individuals with idefrh =3 as a parent according to SCF data. A take-up rate QHPTCTK based on employment income select the appropriate number of beneficiaries according to Portrait de la fiscalité des particuliers au Québec.

**QHPTCTC** QHPTC take-up rate by age of elderly [age,rate]

### **DESCRIPTION**

This is the first take-up rate used in the calculation of imqhptc. It selects an individual with idefrh = 3 and assigns him/her as a parent according to observed probability in SCF. The probability is based on idage.

Beginning in 2001, this credit was extended to include aunt, uncle, great-uncle or great-aunt of the taxpayer of the taxpayer's spouse. The definition of "uncle" and "great-uncle" shall include the spouse of an aunt or great-aunt and vice versa for definition of "aunt" and "great-aunt".

QHSC Quebec Health Services Fund Contribution table

#### **DESCRIPTION**

This table look-up parameter provides the schedule of payments for the Quebec Health Services Fund Contribution (imqhsfc). The first column of the table gives various levels of the health services fund net income. The second column gives the amount of the required contribution. The table is accessed using the lkup1 function which interpolates the lookup in the second column.

This income used to lookup an individual contribution is defined as:

imqitot Total Income

**LESS** 

idiemp Wages and salaries

ididiv * QHSCDIR QHSDIR proportion of dividends imioas * QHSOASFG Optional exemption of OAS benefits

imoasr * QHSOASFG OAS Repayments

imuibr UI Repayments iddalimo Alimony Paid idcarry Carrying charges

imqiloss Allowable investment losses

# **QHSCI** Quebec surtax first cut-in level

# **DESCRIPTION**

This is the level of provincial tax payable (imtxp) above which a surtax at the rate of QHSF applies.

For Quebec, the SPSM calculates provincial surtax (impsur) as QHSF percent of provincial

taxes (imtxp) above the level QHSCI plus QHSF2 percent of provincial taxes above the level QHSCI2.

**QHSF** Quebec surtax first level rate

## **DESCRIPTION**

This is the nominal surtax proportion applied to provincial tax (imtxp) in excess of the level specified in QHSCI.

For Quebec, the SPSM calculates provincial surtax (impsur) as QHSF percent of provincial taxes (imtxp) above the level QHSCI plus QHSF2 percent of provincial taxes above the level QHSCI2.

QITSFSEW Quebec improved tax system for self-employed worker activation flag

#### **DESCRIPTION**

When this parameter is set to 1, the improved tax system for self-employed workers is activated. This improved system was announced in the Quebec 2000 Budget to enable the increasing number of self-employed workers to benefit from the simplified tax form. When this parameter is set to 0, the difference between the flat amount provided under the simplified tax system and the maximum contribution to the CPP/QPP with respect to pensionable self-employed earnings would exclude a number of self-employed workers from the simplified tax system.

This system will standardize the tax treatment applicable to that part of the contribution paid by a worker in respect of pensionable self-employed earnings that could be equated with an employer's contribution, and refrain from excluding a growing number of self-employed workers from the simplified tax system. When activated, it will result in a conversion of QITSSEF of the tax credit granted in respect of amounts payable as contributions on pensionable self-employed earnings to the CPP/QPP into a deduction in the calculation of income. This new deduction will be applied to the calculation of income under the simplified tax system and to the income used to determine the contribution to the Health Services Fund payable by individuals.

# **QLAXPI** Quebec living alone phase-in

# **DESCRIPTION**

This value is used to scale the amount of the reduction which will be applied to the living

alone tax credit. It is used in 1996 to simulate the phase-in of the income testing of the living alone credit.

Legislation relating to this parameter was introduced in the 1996 Quebec Budget which proposed that the non-refundable living alone tax credit "be subject to an income test which would target the assistance to low or modest incomes." Individual living alone with incomes above the threshold of \$26,000 would have the amount of the living alone credit reduced by 15% of income above that threshold. This reduction for higher income seniors was to be phased in over two years, with half the reduction applied in 1996 and the full reduction in 1997 and subsequent years.

See also impatc, QLAXM, QLAXRR, and QLAXTD.

QLAXRR	Quebec living	g alone reduction r	ate			

This parameter is the proportion of net income above a given threshold (QLAXTD) which will be deducted from the non-refundable living alone tax credit amount (QLAXM).

Legislation relating to this parameter was introduced in the 1996 Quebec Budget which proposed that the non-refundable living alone tax credit "be subject to an income test which would target the assistance to low or modest incomes." Individual living alone with incomes above the threshold of \$26,000 would have the amount of the living alone credit reduced by 15% of income above that threshold. This reduction for higher income seniors was to be phased in over two years, with half the reduction applied in 1996 and the full reduction in 1997 and subsequent years.

**QLAXTD** Quebec living alone turn down

#### DESCRIPTION

Individual living alone will have its non-refundable living alone tax credit reduced if its net income is above the value of this parameter.

Legislation relating to this parameter was introduced in the 1996 Quebec Budget which proposed that the non-refundable living alone tax credit "be subject to an income test which would target the assistance to low or modest incomes." Individual living alone with incomes above the threshold of \$26,000 would have the amount of the living alone credit reduced by 15% of income above that threshold. This reduction for higher income seniors was to be phased in over two years, with half the reduction applied in 1996 and the full reduction in 1997 and subsequent years.

# QMAXDX Quebec maximum disability deduction/amount

#### **DESCRIPTION**

This value is used to adjust the imputed Disability Exemption (imdisex) value for blind persons or persons confined to a wheelchair. If an individual has a positive value for imdisex, QMAXDX is assigned as a deduction from net income.

This may also be deducted on behalf of a spouse or dependants.

**QMEDINC** Income definition for Que. refundable tax credit for medical expenses

# **DESCRIPTION**

This parameter defines the income definition to be used in the calculation of Quebec medical expenses (imqmeda) and refundable tax credit for medical expenses (imqmedrc).

When assigned to 1, the income test is based on the net income of the individual and the net

income of the spouse, if applicable. When assigned to 2, the income test is based as the total income (imqitot).

**QMEDRMIN** Minimum earnings for Quebec refundable tax credit for medical expenses

#### **DESCRIPTION**

If employment earnings are less than this parameter, then a person is eligible to apply for the Quebec refundable tax credit for medical expenses (imqmedrc). Earnings are calculated as employment income (idiemp) plus self-employment income (idisenf + idisefm) minus registered pension plan deduction (idrpp) minus annual union, professional, or like dues (iddues) minus other employment expenses (idalexp).

#### QMRTCFLG Quebec refundable tax credits for medical expenses activation flag

#### **DESCRIPTION**

When QMRTCFLG is assigned to 1, the Quebec refundable tax credit for medical expenses (imqmedre) is calculated for persons aged 18 and over who had employment related earnings greater than QMEDRMIN. The maximum refundable credit will be the lesser of QMEDRMAX and QMEDRATE percent of eligible medical expenses (imqmeda). It is reduced by QMEDRRR percent of net family income in excess of QMEDRTD.

When QMRTCFLG is assigned to 0, the calculation of the Quebec refundable tax credit for medical expenses is suppressed.

**QMXM** 

In calculating tax able income for Quebec Provincial Income Tax, all married filers are eligible to claim this amount as an exemption on behalf of a dependent spouse or, in the absence of a spouse, of a dependent child. The amount is reduced by the income in excess of the reduction level (QMXT).

#### **QNBFA**

Quebec newborn family allowance [parity,age]

#### **DESCRIPTION**

The Quebec Newborn Family Allowance program began in 1988. The rows in this parameter correspond to the rank of the child in the family in increasing order. The columns correspond to the age of the child. The value of each cell represents the dollar value of the benefits. The parameter is effective only when QNBFAFLAG is set to 1.

Starting in 1998, the program is replaced by the Quebec Family Allowance Tax Credit which is activated when QFATCOPT is set to 2. The Newborn Allowance gradually phases out for those who were already in the program.

For more details see QFATCOPT.

#### QNBFAFLAG Quebec newborn family allowance flag

#### **DESCRIPTION**

When QNBFAFLAG is set to one the Quebec Newborn allowance is implemented. The benefits are set according to the rank of the newborn in the family, at the birth time. Observed rank can be different from the allocation rank, the opportunity of increasing the rank is set with the flag QNBRFLAG.

Starting in 1998, the program is replaced by the Quebec Family Allowance Tax Credit which is activated when QFATCOPT is set to 2. The Newborn Allowance gradually phases out for those who were already in the program.

For more details see QFATCOPT.

# QNBPOFLAG Quebec newborn family allowance phase out flag

#### **DESCRIPTION**

This parameter activates the phase out of the Quebec Newborn Family Allowance. Children born after 30 September 1997 are not eligible to receive the allowance for newborn children. As a result, this program will progressively disappear until the year 2002. Any child whose age is equal to the difference between TARGETYEAR and QNBPOYR, and whose month of birth is greater than September, which is determined by comparing a random number to QNBPOPYR, would not be eligible for the newborn allowance.

See also QNBFAFLAG.

This parameter represents the proportion of the phase out year of the Quebec Newborn Family Allowance where children would still be eligible for the allowance. Children born after 30 September 1997 are not eligible to receive the allowance for newborn children. The phase out is activated by QNBPOFLAG. Any child whose age is equal to the difference between TARGETYEAR and QNBPOYR, and whose month of birth is greater than September (if a random number is greater than this parameter), would not be eligible for the newborn allowance.

See also QNBFAFLAG.

QNBRFLAG Quebec newborn family random increase of child rank

When QNBRFLAG is set to one then rank of children in a family of age 1 and 2 is randomly increase to reflect the rank structure observed by the Régie des rentes du Québec. When the rank is increase, rank of older children is also increased.

Starting in 1998, the program is replaced by the Quebec Family Allowance Tax Credit which is activated when QFATCOPT is set to 2. The Newborn Allowance gradually phases out for those who were already in the program.

For more details see QFATCOPT.

QNFSDED income flag	Quebec	deduction of net federa	al supplements (SPA and GIS) from net

# **DESCRIPTION**

This parameter denotes the application of net federal supplements (guaranteed income supplements (imigis) and spousal allowances (imispa)) in the calculation of taxable income for Quebec provincial taxes. When this parameter is assigned to 1, the net federal supplements are added to the total deductions from net income (imqdedfn). Under the simplified tax system, when this parameter is assigned to 1, the net federal supplements are deducted from net income in the calculation of taxable income. When this parameter is 0, the net federal supplements are not deducted from net income (imqinet). This represents a change to the Quebec Income Tax forms in 1994.

# **QNORTHFLAG** Database variable(north) activation flag

# **DESCRIPTION**

When this parameter is set to 1, the imputed variable for the designated area deduction (idnorth) is included in the calculation of all Quebec deductions from net income (imqdedfn).

With a value of zero the designated deduction variable is not used.

OGADED				
QSADED	Quebec d	leduction of social assi	stance ben	efits from net income flag

This parameter denotes the application of social assistance benefits (imisa) in the calculation of taxable income for Quebec provincial taxes. When this parameter is assigned to 1, the social assistance benefits are added to the total deductions from net income (imqdedfn). Under the simplified tax system, when this parameter is assigned to 1, the social assistance benefits are deducted from net income in the calculation of taxable income. When this parameter is 0, the social assistance benefits are not deducted from net income (imqinet). This represents a change to the Quebec Income Tax forms in 1994 and 1998.

**QSFDISFLAG** Quebec Simplified Form Disability tax credit inclusion flag

### **DESCRIPTION**

When this flag is turned on, people filling out the simplified tax form (imqsfflg = 1) can claim the amount for severe and prolonged mental or physical impairment (imqdistc).

See QSFOPT for more information on the simplified tax form.

**QSFOPT** 

Quebec Simplified Form Option (1=general 2=simplified 3=optimized)

### **DESCRIPTION**

This parameter controls whether or not the simplified tax form is used in Quebec. The simplified tax program, which includes a flat tax credit, started in 1998. People were allowed to decide whether it was in their benefit to fill out the simplified or general tax form. A worksheet was provided in order to facilitate the choice.

The SPSM has implemented this tax system in the following way. When QSFOPT is set to 1, everyone in Quebec fills out the general tax form. This is the system which was in place prior to 1998. If QSFOPT is set to 2, then everyone fills in the simplified tax form. And when QSFOPT is set to 3, then an optimization procedure is run. In this scenario, an approximation of the worksheet which was provided with the 1998 tax form is calculated prior to the computation of taxes. People are assigned to either the general tax form (which includes all deductions) or the simplified tax form (which includes few deduction but an additional credit - QSFTC). The variable imqsfflg notes which form was chosen.

A person can transfer all of their extra credits and deductions to their spouse when both spouses fill out the simplified tax form. When using the general form, only a limited number of deductions can be transferred. Because the worksheet does not take into account all the inter-spouse complexities, the optimization procedure will tend to overstate taxes. While it is very accurate for single persons, it tends to maximize the individual's gain which is not necessarily the couple's gain. The model may therefore slightly overstate Quebec taxes.

**QSFSMXI** Quebec simplified form spouse maximum income for work sheet

### **DESCRIPTION**

This amount is used in the work sheet to determine which tax form in Quebec can be used (simplified or general) when QSFOPT = 3. When the spouse's income is less than this amount, the spouse's QSFTC can be included in the work sheet.

See QSFOPT for more information on the simplified tax form.

**QSFTC** Quebec Simplified Form tax credit

# **DESCRIPTION**

This is the value of the flat amount which people who filled the Simplified Tax System were allowed to add to their Basic Amount (QBXM). Only people who file a simplified tax form (imqsfflg = 1) get this amount. In a previous version of the model, it was entitled the low income credit.

See QSFOPT for more information on the simplified tax form.

**QSPBFLAG** Quebec inclusion of social program benefits in income flag

#### **DESCRIPTION**

This parameter denotes the application social program benefits, namely social assistance benefits (imisa) and net federal supplements (guaranteed income supplements (imigis) and spousal allowances (imispa)), in the calculation of net income (imqinet) for Quebec provincial taxes. When this parameter is assigned to 1, social assistance benefits and net federal supplements are added to total income (imqitot). When this parameter is 0, social assistance benefits and net federal supplements are not added to total income. This

represents a change to the Quebec Income Tax forms in 1994.

**QSTRBCRD** Quebec sales tax rebate base credit

#### **DESCRIPTION**

This amount is the base credit used to calculate the Quebec sales tax refund (imqstr) for Quebec Provincial Income Tax. The credit is base on family income (QSTROPT = 2) except for the first year of implementation where it is base on imigis (QSTROPT= 1). The calculation of the Sales Tax Rebate is activated with QSTRFLAG. A credit (QSTRCHILD) is added for each child in the family. A second credit is added (QSTRFTP3) when no spouse is present and at least one dependent child is present, and finally another credit is added (QSTRFTP4) is for a person living alone or with at least one dependent. The credit is reduced by the income considered at a rate QSTRRR.

**QTROPT** Quebec Tax Reduction calcualtion option 1=universal 2=income tested

#### **DESCRIPTION**

When this parameter has a value of 1 the Quebec provincial tax reduction (imptr) will be calculated as a flat rate (QTRP) proportion of provincial tax payable (imtxp).

With a value of 2, the Quebec income tested provincial tax reduction (imqittr) will be calculated. The amount of this reduction varies with basic provincial tax payable (imbpt) phasing out to zero at the QTRBE level of basic tax payable. The maximum tax reduction possible can be calculated by multiplying QTRBE times QTRP.

QTX Quebec income tax table [taxable income,basic provincial tax]

#### **DESCRIPTION**

This table represents the Taxable Income/Tax Rate tax curve for Quebec. The first column represents a level of taxable income defining the lower limit of a range. The second column is the amount of Basic Provincial Tax payable at the corresponding taxable income. The third column represents the marginal tax rate for the income range. Only the first and third columns of this table need be specified in the parameter file.

**QYPPI** Quebec deduction phase-in for pension income

#### **DESCRIPTION**

This value is used to scale the amount of the reduction which will be applied to the pension income tax credit. It is used in 1996 to simulate the phase-in of the income testing of the pension income credit.

Legislation relating to this parameter was introduced in the 1996 Quebec Budget. Individual seniors with pension incomes (idipens) above the threshold (QYPTD) of \$26,000 would have the amount of the maximum pension income credit (QYPDL) reduced (QYPRR) by 15% of income above that threshold. This reduction for higher income pensions was to be phased in over two years, with half the reduction applied in 1996 and the full reduction in 1997 and subsequent years.

See also imqritc, QYPRR, QYPDL, QYPTD.

**QYPRR** Quebec deduction reduction rate for pension income

#### **DESCRIPTION**

This parameter is the proportion of net pension income above a given threshold (QYPTD) which will be deducted from the non-refundable pension income tax credit amount (QYPDL).

Legislation relating to this parameter was introduced in the 1996 Quebec Budget. Individual seniors with pension incomes (idipens) above the threshold (QYPTD) of \$26,000 would have the amount of the maximum pension income credit (QYPDL) reduced (QYPRR) by 15% of income above that threshold. This reduction for higher income pensions was to be phased in over two years, with half the reduction applied in 1996 and the full reduction in 1997 and subsequent years.

See also imqritc, QYPTD, QYPPI.

#### **DESCRIPTION**

Individual seniors will have their non-refundable pension income tax credit reduced if their net pension income is above the value of this parameter.

Legislation relating to this parameter was introduced in the 1996 Quebec Budget. Individual seniors with pension incomes (idipens) above the threshold (QYPTD) of \$26,000 would have the amount of the maximum pension income credit (QYPDL) reduced (QYPRR) by 15% of income above that threshold. This reduction for higher income pensions was to be phased in over two years, with half the reduction applied in 1996 and the full reduction in 1997 and subsequent years.

See also imqritc, QYPRR, QYPPI.

### **REFFLAG** Read reference results file

### **DESCRIPTION**

This parameter invokes the reference variable facility. When this parameter is set to 1, the model will read a series of variables (REFVARS) from an SPSM results file (INPREF). Please see the *User's Guide* for details on the results file facility.

**REFVARS** Reference results file variables [string]

### DESCRIPTION

The REFVARS parameter lists the names of the variables that the user wishes to read from the results file, and can optionally be used to re-name these variables as well. Please see the *User's Guide* for details on the results file facility.

## **REPNETFLAG** Social program repayments reduce net income flag

### **DESCRIPTION**

When set to 1, repayment of social benefits (UI, OAS, FA) are used to reduce net income.

## **CROSS REFERENCE**

**ROUNDFLAG** Round disposable and consumable income

## **DESCRIPTION**

ROUNDFLAG is normally activated, so that consumable and disposable income are rounded

to the nearest dollar before being used for reporting or output purposes. Because SPSM results files always contain rounded data, this action ensures that base/variant comparisons that use disposable or consumable income will be identical whether BASMETH is 1 (read results file) or 2 (create base variables through simulation). When ROUNDFLAG is set to 0, this action is turned off. This action is useful in conjunction with the turning point facility, because otherwise the rounding of consumable income produces a large number of spurious turning points in the household tax function.

**RRSPEINC** Increment to rrsp if conditions & rpp>0

### **DESCRIPTION**

This parameter, defined in the database adjustment parameter file, is one of a group of parameters which allow the user to modify (generally increase) base year database values for RRSP contributions. RRSPEINC will be added to the RRSP contributions of all persons covered by a registered pension plan whose current RRSP contributions fall between RRSPEMIN and RRSPEMAX.

**RRSPEMAX** Maximum (rpp+rrsp) for increment if rpp>0

### **DESCRIPTION**

This parameter, defined in the database adjustment parameter file, is one of a group of parameters which allow the user to modify (generally increase) base year database values for RRSP contributions. Please see the description of RRSPEINC.

**RRSPEMIN** Minimum (rpp+rrsp) for increment if rpp>0

### DESCRIPTION

This parameter, defined in the database adjustment parameter file, is one of a group of parameters which allow the user to modify (generally increase) base year database values for RRSP contributions. Please see the description of RRSPEINC.

### DESCRIPTION

This parameter, defined in the database adjustment parameter file, activates a group of parameters which allow the user to modify (generally increase) base year database values for RRSP contributions. Please see the description of RRSPEINC and RRSPSINC.

**RRSPSINC** Increment to rrsp if conditions & rpp=0

#### **DESCRIPTION**

This parameter, defined in the database adjustment parameter file, is one of a group of parameters which allow the user to modify (generally increase) base year database values for RRSP contributions. RRSPSINC will be added to the RRSP contributions of all persons not covered by a registered pension plan whose current RRSP contributions fall between RRSPSMIN and RRSPSMAX.

**RRSPSMAX** Maximum (rrsp) for increment if rpp=0

### DESCRIPTION

This parameter, defined in the database adjustment parameter file, is one of a group of parameters which allow the user to modify (generally increase) base year database values for RRSP contributions. Please see the description of RRSPSINC.

**RRSPSMIN** Minimum (rrsp) for increment if rpp=0

### DESCRIPTION

This parameter, defined in the database adjustment parameter file, is one of a group of parameters which allow the user to modify (generally increase) base year database values for RRSP contributions. Please see the description of RRSPSINC.

### **DESCRIPTION**

When the value of SAFLAG is set to 1, this parameter determines the way in which Social Assistance Payments (imisa) will be calculated for the elderly. There are three valid values for SAELDOPT:

- 1. Social Assistance is set to zero for all persons over age 65
- 2. Social Assistance (imisa) is set to zero for individuals age 65 and over receiving simulated GIS Supplementation Benefits (imigist), otherwise it is set equal to Reported Social Assistance (idisa).
- 3. Social Assistance is set equal to the positive difference between reported social assistance and simulated GIS supplements

imisa = idisa - imigist

**SAFS** 

Federal share of social assistance [prov]

### DESCRIPTION

In version 5.0 and earlier, this parameter was a single proportion used to determine the proportional splitting of Social Assistance payments between federal and provincial governments. It is now implemented as a vector of ten individual provincial proportions to correctly account for the modified limits to the growth of CAP payments by the federal government.

This vector parameter is used to determine the proportional splitting of Social Assistance payments between individual provinces and the federal government. This splitting is performed inside the samod function and corresponds to the federal/provincial cost sharing agreements in the Canada Assistance Plan. The value of SAFS is the proportion of reported social assistance which is paid by provincial governments.

SAMPLE
             Size of sample obtained
```

#### DESCRIPTION

This parameter reports the proportion of sample used for processing. Valid values range from 0 to 1. Should the user interrupt a model run in progress the correct sampling ratio will be calculated and output in the control parameter (.cpr) file.

## **SAMPLEREQ** Size of sample requested

### **DESCRIPTION**

This control parameter allows the user to indicate the size of the sample requested for processing. The size of the sample actually obtained will be recorded in SAMPLE, and may differ from SAMPLE for a number of reasons among which are:

- The input database file given by INPSPD had fewer records than required to generate the requested sample.

- The input results file given by INPBASMRS had fewer records than required because it was generated with a sample smaller than SAMPLEREQ.
- An SPSM execution always occurs with an integral number of households, therefore the resulting sample may deviate slightly from that requested.

**SAMTOPT** Sask. alternative minimum tax option (1=none, 2=% fed, 3=fed adjusted net income)

#### DESCRIPTION

When Saskatchewan tax on taxable income is calculated (STXFLG = 1), there are three options as to how to calculate the provincial minimum tax.

When SAMTOPT is set to 1, then no provincial alternative minimum tax is calculated.

When SAMTOPT is set to 2, then a percentage (SAMTPCTF) of the additional federal tax due to the minimum tax is added to the basic provincial tax (imbpt).

When SAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the SAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

**SAMTTX** 

Sask. amt rate as tax on adjusted income

### **DESCRIPTION**

When Saskatchewan tax on taxable income is calculated (STXFLG=1) and SAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the SAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

SAPFLAG	Social assi	stance predict	ed valu	ıe flag				

## **DESCRIPTION**

When SAPFLAG is set to 1, predicted values of social assistance are used. Predicted values are equal to idisa when SATARGET is set to 0.5. Users can increase or decrease the number of families receiving SA by increasing or decreasing SATARGET.

Interval between 0.5 and 0.95 allows for a maximum increase of 3% in the number of families receiving SA. Interval between 0.05 and 0.5 allows for a maximum decrease of 3% in the number of families receiving SA. Individuals are selected and get idsapred when idsarank/1000 is lower than SATARGET.

See idsapred, idsarank.

### **DESCRIPTION**

This control parameter if used to activate the SAS native file output facility. A self-documenting file with name OUTSAS in SAS Version 6.03 format is produced containing variables given by SASVARS rolled up to the level specified by SASUNIT. To produce a SAS data file in the user's SAS version, a PROC COPY into an empty directory should do it. Please see the *User's Guide* for more information.

**SASKC** Saskatchewan GIS supplement: married pensioners

## **DESCRIPTION**

Maximum annual Saskatchewan Income Plan benefits for each person in a married couple where both receive OAS/GIS. Calculated as a sum of monthly maximums.

## **SASTITLE** SAS file label [string]

### **DESCRIPTION**

This control parameter, when activated by SASFLAG, gives the internal label which will be written into the header of the native SAS file given by OUTSAS. This label is used by the SAS system by certain procedures, in particular PROC CONTENTS.

**SASUNIT** SAS output family level

### **DESCRIPTION**

When the SAS file output facility is activated using the SASFLAG parameter, this control parameter is used to specify the family level of analysis of the resulting file. Each record on the output file will correspond to an entity given by SASUNIT. Valid values and their meanings are given below.

0 Individual

Nuclear Family
Census Family
Economic Family
Household

The default value of SASUNIT is 0.

**SASVARS** Variables selected for SAS output [string]

### **DESCRIPTION**

This control parameter, when activated by SASFLAG, gives a list of all variables to be written to each record of the resulting SAS native file. Any SPSD/M variable, including base and variant values, may be included.

**SATARGET** Social assistance target for predicted SA

### **DESCRIPTION**

When SAPFLAG is set to 1, predicted values of social assistance are used. Predicted values are equal to idisa when SATARGET is set to 0.5. Users can increase or decrease the number of families receiving SA by increasing or decreasing SATARGET.

Interval between 0.5 and 0.95 allows for a maximum increase of 3% in the number of families receiving SA. Interval between 0.05 and 0.5 allows for a maximum decrease of 3% in the number of families receiving SA. Individuals are selected and get idsapred when idsarank/1000 is lower than SATARGET.

See SAPFLAG, idsapred, idsarank.

For more information on how to change the number of SA recipients, see the <u>User's Guide</u> under Miscellaneous Facilities.

### **SBOPTFLG** Optimize Seniors benefit with OAS/GIS

#### **DESCRIPTION**

When SBOPTFLG has a value of 0, the calculation of the federal Senior's Benefit is always used. When SBOPTFLG parameter is assigned a value of 1, the Seniors Benefit calculation is optimized for the nuclear family with respect to OAS/GIS. That is, the nuclear family's consumable income is calculated under the rules for both the Seniors Benefit and the rules for OAS/GIS. Whichever program results in the higher consumable income is the program whose benefits which will be assigned to the individual.

# SBRL1 Seniors Benefit first benefit reduction plateau

#### **DESCRIPTION**

The federal Seniors Benefit is reduced by a proportion (SBRR1) of income (imsbinc) until it reaches (SBRL1). Beginning at a nuclear family income level (imsbinc) of SBRL2, the benefit is further reduced by a proportion SBRR2 of additional income (imsbinc). SBRL1 is equivalent to BOAS that year.

### **SBRL2** Seniors Benefit Second reduction level

### **DESCRIPTION**

The federal Seniors Benefit is reduced by a proportion (SBRR1) of income (imsbinc) until it

reaches (SBRL1). Beginning at a nuclear family income level (imsbinc) of SBRL2, the benefit is further reduced by a proportion SBRR2 of additional income (imsbinc).

**SBSPA** Seniors Benefit maximum rate for SPA

### **DESCRIPTION**

This parameter is used in the calculation of SPA (imisbspa) when the federal Senior's Benefit flag (SBFLAG) is set to one. It is equivalent to what the maximum dollar benefits of the Guaranteed Income Supplement portion of Extended Spouses Allowance for widowed SPA recipients would have been in that year.

SCBRR1

Sask Child Benefit 1st reduction rate [number of kids]

#### DESCRIPTION

The Saskatchewan Child Benefit is reduced in two stages. Net family income greater than SCBTD1 and less than SCBTD2 is reduced at a rate of SCBRR1. This is a vector parameter which depends on the number of children. The benefit is further reduced at a rate of SCBRR2 for income over SCBTD2

# SCBRR2 Sask Child Benefit 2nd reduction rate [number of kids]

#### **DESCRIPTION**

The Saskatchewan Child Benefit is reduced in two stages. Net family income greater than SCBTD1 and less than SCBTD2 is reduced at a rate of SCBRR1. The benefit is further reduced at a rate of SCBRR2 for income over SCBTD2. This rate depends on the number of children in the family.

**SCGTC** Sask. Caregiver Tax Credit

### **DESCRIPTION**

SCGTC multiplied by SPNTCR is the maximum amount of the Saskatchewan Caregiver Tax Credit (impcgtc). The parameter is only used when the provincial tax on taxable income is calculated (STXFLG = 1).

For more explanation see SCGTCFLG.

**SCGTCFLG** Sask. Caregiver Tax Credit activation flag

#### **DESCRIPTION**

The calculation of the Saskatchewan Caregiver Tax Credit (impcgtc) is activated by the flag SCGTCFLG.

The Caregiver Tax Credit (impcgtc) provides additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is SCGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate SCGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate SCGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, impcgtc, is reduced for each dollar of net income, iminet, in excess of SCGTCTD.

This non-refundable tax credit is only calculated when the provincial tax on taxable income is calculated (STXFLG = 1).

### **DESCRIPTION**

This is the first take-up rate used in the calculation of Saskatchewan's impogtc. It selects an individual with idefrh = 3 and assign him/her as a parent according to observed probability in SCF. The probability is also based on idage.

The parameter is only used when the provincial tax on taxable income is calculated (STXFLG = 1).

**SEED** Random number generator seeds

#### **DESCRIPTION**

This vector control parameter is used to start the streams of pseudo-random numbers used in the model. Up to 20 independent random numbers are generated for each individual and are stored in the variables idrand0 through idrand19. A different sequence of numbers for each activated stream can be generated by changing SEED. The number of streams activated is determined by the number of elements in SEED. Random numbers are be used to apply social program or demographic take-up rates.

**SELFLAG** Selection facility activation flag

#### DESCRIPTION

The SELFLAG control parameter is used to activate the SPSM selection facility. When SELFLAG is set to 1, the expression in SELSPEC is evaluated for each individual and the result (if true) is propagated to families at the SELUNIT level of analysis. Only individuals (or families) marked as selected will be included in any generated files or reports.

SELMAX has been added as an enhancement to the SPSM selection facility. If SELMAX is left at its default value of 0, the selection facility operates as described in the <u>User's Guide</u>. If it is set to a positive integer, SPSM will stop reading the database as soon as SELMAX households have been read. This is useful if the user wished to select just one or a few households for detailed analysis, for example with the turning point facility, or using the detailed reporting capabilities of the text file output facility.

SELSPEC

Selection specification [string]

#### DESCRIPTION

This control parameter, when activated by SELFLAG, is used to specify whether an individual is to be marked as selected or not for the purposes of output and reporting. The expression if evaluated for each individual and is considered true if the result is non-zero. Any SPSD/M variables, including base and variant tax/transfer variables, may be used in SELSPEC. Please see the *User's Guide* for more information.

**SELUNIT** 

Selection facility family level

#### DESCRIPTION

This control parameter, when activated by SELFLAG, is used to specify the level to which individual selection (computed by applying the expression in SELSPEC) is to be propagated. If SELUNIT is 0, selection remains at the level of individual. If SELUNIT is 1, 2, 3, or 4, then selection of any individual in the family unit implies selection of all members in the unit. Valid values of SELUNIT and their meanings are given below.

- 0. Individual
- 1. Nuclear Family
- 2. Census Family
- 3. Economic Family
- 4. Household

The default value of SELUNIT is 0.

This parameter represents the equivalent to married tax credit when Saskatchewan tax is calculated as a tax on taxable income. It is only calculated when STXFLG is set to 1.

**SEMXMT** Sask. equivalent to married turndown level

#### **DESCRIPTION**

This parameter represents the provincial equivalent to married exemption turndown when Saskatchewan tax is calculated as a tax on taxable income. It is only used when STXFLG is set to 1. The reduction is calculated as the dependant's net income less the turndown SEMXMT.

**SLVCMAX** Maximum Sask. labour-sponsored funds tax credit allowed

### **DESCRIPTION**

This is the maximum value for the Saskatchewan labour sponsored funds tax credit (implvctc). The credit is derived as a proportion SLVCRT of the cost of the funds bought (idlabtxg) up to a maximum value SLVCMAX.

In some years, there is a difference in rates between provincially registered funds and federally registered funds. The model assumes that all funds are federally registered.

## **SMAXDX** Sask. Maximum Disability deduction/amount

### **DESCRIPTION**

This value represents the maximum Saskatchewan non-refundable disability tax credit. It is given to all individuals with a positive value for imputed Disability Deduction (imdisex).

The parameter is only used when the provincial tax on taxable income is calculated (STXFLG = 1).

### **SPAEFLAG** Extended SPA eligibility probabilities flag

### **DESCRIPTION**

When the value of this parameter is 1, specific probabilities are applied to determine eligible population for extended SPA (SPAFE & SPAME). Eligibility is determined from the probability that a widow(er) currently aged 60-64 had a spouse aged 65+ at the time of his(her) death.

SPAFE	SPA tak	e-up rate: eligible f	emale widow [age,probability]

#### **DESCRIPTION**

These are probabilities applied to determine eligible female population for extended SPA. Eligibility is determined from the probability that a widow(er) currently aged 60-64 had a spouse aged 65+ at the time of his(her) death.

For widow(er)s currently aged 60, these probabilities were estimated using 1980-82 mortality rates for the married population and the age distribution of spouses as tabulated from the 1981 Census. This provides a distribution for the age at death of the spouse. The probability of eligibility is the ratio of spouse deaths at ages 65+ to all spouse deaths.

For widow(er)s currently aged 61-64, allowance is made for the possibility that the death took place in a previous year. In that event, age at death distributions are calculated as before and aggregated over the 2-4 year intervals in which the death might have occurred. Aggregation involves adjustment for the mortality of the widowed partner. In this case, the probability of eligibility is the ratio of spouse deaths at age 65+ with surviving partners to all spouse deaths with surviving partners.

**SPAXO** Benefit Cross-over GIS/SPA vs GIS one pensioner couple

### **DESCRIPTION**

SPAXO represents the level of family income at which the dollar benefits for GIS to a single pensioner married to a non-pensioner spouse exactly equal the combined GIS/SPA dollar benefits payable to a GIS/SPA married couple. The figure is calculated as a fixed relationship to other input parameters as follows. This is a derived parameter calculated in mpc.c.

SPAXO = 2*MP.GISBE2-MP.GISBE1;

#### **CROSS REFERENCE**

Function	Description
gis mpc	Compute GIS/SPA for elderly Calculate derived model parameters and do edits

This single parameter sets the tax credit rate for all of the non-refundable tax credits in Saskatchewan. Each tax credit is calculated separately and summed for a total credit. The parameter is only used when a provincial tax on taxable income is calculated (STXFLG = 1).

**SPTX** Sask. tax table [taxable income,basic provincial tax]

### **DESCRIPTION**

This table represents the Saskatchewan tax curve used when calculating the tax on taxable income (STXFLG = 1). The first column represents Taxable Income, the second represents the amount of Basic Provincial Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

#### **SSTC1KIDTD** Sask. sales tax credit child amount turndown if only 1 child

## **DESCRIPTION**

This represents the income level at which the child component of the Saskatchewan Sales Tax Credit is to be reduced at the rate of SSTCRR for families with one qualifying child.

The Saskatchewan Sales Tax Credit (imsstc) was introduced in 2000 to offset the effect of sales taxes on lower income earners. The Saskatchewan Sales Tax Credit will consist of an adult component and a child component. This credit will be fully refundable. The program is activated when SSTCFLAG is set to 1.

See also SSTCBAS, SSTCSP, SSTCKID.

SSTCBAS	Sask. sales	s tax credit base amount

## **DESCRIPTION**

This parameter represents the maximum amount for the adult component of the Saskatchewan Sales Tax Credit (imsstc). The adult component of the Saskatchewan Sales Tax Credit will rise at a rate of SSTCBASPIR of individual net income up to this maximum. It will be reduced at a rate of SSTCRR as family net income increases above SSTCBASTD.

#### **SSTCFLAG** Sask. sales tax credit activation flag

#### **DESCRIPTION**

The Saskatchewan Sales Tax Credit is activated when this parameter is set to 1.

The Saskatchewan Sales Tax Credit was introduced in 2000 to offset the effect of sales taxes on lower income earners. The Saskatchewan Sales Tax Credit (imsstc) will consist of an adult component and a child component. This credit will be fully refundable and is assigned to the spouse with the higher income.

The adult component of the Saskatchewan Sales Tax Credit will rise at a rate of SSTCBASPIR of individual net income up to a maximum (SSTCBAS). It will be reduced at a rate of SSTCRR as family net income increases above SSTCBASTD. An individual will also be eligible for SSTCSP in additional benefits for a dependent spouse or equivalent. This amount will be reduced at a rate of SSTCRR as family net income rises over SSTCSPTD.

The child component of the Saskatchewan Sales Tax Credit will provide an additional SSTCKID per child. For two-parent families, the maximum child component will be SSTCKID + SSTCKID. For single parent families, the first child will be eligible for the adult benefit of SSTCSP and the maximum child component will be SSTCKID. The child component of the Credit will be reduced at a rate of SSTCRR as family net income rises over

SSTC1KIDTD for families with one qualifying child. For families with more than one qualifying child, the Credit will be reduced at a rate of SSTCRR as family net income rises over SSTC2KIDTD.

**SSTCPI** Sask. sales tax credit phase in

#### **DESCRIPTION**

This parameter provides the phase in rate for the Saskatchewan Sales Tax Credit (imsstc) was introduced in the 2000 Saskatchewan Budget. This credit is effective as of April 1, 2000, and is designed to offset the effect of sales taxes on lower income earners. The Saskatchewan Sales Tax Credit will consist of an adult component and a child component. This credit will be fully refundable. The program is activated when SSTCFLAG is set to 1.

See also SSTCBAS, SSTCSP, SSTCKID.

SSTCRR	Sask. sales tax	credit reduction rate

#### **DESCRIPTION**

This parameter represents the rate at which the Saskatchewan Sales Tax Credit (imsstc) amount is to be reduced. The basic adult component (SSTCBAS) will be reduced at this rate when family net income exceeds SSTCBASTD. The spousal equivalent credit (SSTCSP) will be reduced at this rate when family net income rises over SSTCSPTD.

The child component of the Credit will be reduced at this rate as family net income rises over SSTC1KIDTD for families with one qualifying child. For families with more than one qualifying child, the Credit will be reduced at this rate as family net income rises over SSTC2KIDTD.

See also SSTCKID.

ba05.mpr:	0.0100	0	0.0%	Copi	ed	from	ba04.mpr

This is the maximum value of the spousal equivalent amount of the Saskatchewan Sales Tax Credit. An individual will be eligible for this amount in additional benefits for a dependent spouse or equivalent. This amount will be reduced at a rate of SSTCRR as family net income rises over SSTCSPTD.

In the case of a single parent family, the first child will be eligible for this amount.

The Saskatchewan Sales Tax Credit (imsstc) was introduced in 2000 to offset the effect of sales taxes on lower income earners. The Saskatchewan Sales Tax Credit will consist of an adult component and a child component. This credit will be fully refundable. The program is activated when SSTCFLAG is set to 1.

**SSTCSPTD** Sask. sales tax credit spousal amount turndown

## **DESCRIPTION**

This parameter represents the income level at which the spouse equivalent component (SSTCSP) of the Saskatchewan Sales Tax Credit is reduced at the rate of SSTCRR.

The Saskatchewan Sales Tax Credit (imsstc) was introduced in 2000 to offset the effect of sales taxes on lower income earners. The Saskatchewan Sales Tax Credit will consist of an adult component and a child component. This credit will be fully refundable. The program is activated when SSTCFLAG is set to 1.

This control parameter, when set to 1, activates hard-wired Table 0A, which contains counts of units having non-zero values for various variables. The level of analysis is specified by the TABUNIT parameter.

The default value of TOAFLAG is 0.

**T0FLAG** Canada totals table flag (Dollars)

#### **DESCRIPTION**

This control parameter, when set to 1, activates hard-wired Table 0, which contains counts and sums of various variables. The level of analysis is specified by the TABUNIT parameter.

The default value of T0FLAG is 1.

**T1AFLAG** Provincial totals table flag (Units)

#### DESCRIPTION

This control parameter, when set to 1, activates hard-wired Table 1A, which contains counts of units having non-zero values for various variables by province. The level of analysis is specified by the TABUNIT parameter.

The default value of T1AFLAG is 0.

**T1FLAG** Provincial totals table flag (Dollars)

#### DESCRIPTION

This control parameter, when set to 1, activates hard-wired Table 1, which contains counts and sums of various variables by province. The level of analysis is specified by the TABUNIT parameter.

The default value of T1FLAG is 1.

This control parameter, when set to 1, activates hard-wired Table 2A, which contains counts of units having non-zero values for various variables by income classes as determined by the breakpoints specified in the INCGP parameter. The level of analysis is specified by the TABUNIT parameter.

The default value for T2AFLAG is 0.

T2FLAG

Income group totals table flag (Dollars)

### **DESCRIPTION**

This control parameter, when set to 1, activates hard-wired Table 2, which contains counts and sums of various variables by income classes as determined by the breakpoints specified in the parameter INCGP. The level of analysis is specified by the TABUNIT parameter.

The default value of T2FLAG is 0.

### **T3AFLAG** Family type totals table flag (Units)

#### DESCRIPTION

This control parameter, when set to 1, activates hard-wired Table 3A, which contains counts of units having non-zero values by family type. The level of analysis is specified by the TABUNIT parameter.

The default value for T3AFLAG is 0.

# **T3FLAG** Family type totals table flag (Dollars)

#### DESCRIPTION

This control parameter, when set to 1, activates hard-wired Table 3, which contains counts and sums of various variables by family type. The level of analysis is specified by the TABUNIT parameter.

The default value for T3FLAG is 0.

### **T4AFLAG** LICO ratio group totals table flag (Units)

#### DESCRIPTION

This control parameter, when set to 1, activates hard-wired Table 4A, which contains counts of units having non-zero values by poverty threshold ratio classes given by PVRAT and PTF. The level of analysis is specified by the TABUNIT parameter.

The default value for T4AFLAG is 0.

**T4FLAG** LICO ratio group totals table flag (Dollars)

### **DESCRIPTION**

This control parameter, when set to 1, activates hard-wired Table 4A, which contains counts and sums of various variables by poverty threshold ratio classes given by PVRAT and PTF. The level of analysis is specified by the TABUNIT parameter.

The default value for T4FLAG is 0.

#### **TABDELTA** Built-in tables winner/loser threshold

#### **DESCRIPTION**

This is the dollar amount used to determine winners and losers for purposes of producing certain rows of the hard-wired tables. The difference in consumable income between base and variant is compared to TABDELTA at the TABUNIT level of analysis to determine a winner or loser.

The default value of TABDELTA is 10.00.

**TABUNIT** Built-in tables family level

### **DESCRIPTION**

Reporting variables are summed over the family unit specified by TABUNIT in order to

produce the hard-wired tables. Valid values and their meanings are given below.

- 0. Individual
- 1. Nuclear Family
- 2. Census Family
- 3. Economic Family
- 4. Household

The default value of TABUNIT is 2.

# TARGETYEAR Year of analysis

# **DESCRIPTION**

This parameter controls the phasing in of certain social support programs. Valid values include all 4 digit integers listed below (e.g. 1994 is a valid value).

### **TPFLAG** Turning point facility activation flag

### **DESCRIPTION**

TPFLAG is used to activate the turning point facility.

**TPLL** Lower limit for modified variables

### **DESCRIPTION**

TPLL specifies the lower limit of the independent variable for use in the turning point facility.

**TPMETH** Method for modifying variables [1=additive, 2=multiplicative]

#### DESCRIPTION

TPMETH indicates which of two methods the turning point facility will use to modify the independent variables in TPVARS for the persons identified by TPSPEC, in order to compute the household tax function. Method 1 changes the variables in TPVARS between the limits given by TPLL and TPUL. Method 2 scales the variables relative to their original database values between the limits given by TPLL and TPUL.

TPSPEC, used in the turning point facility, is a logical expression in SPSM variables that identifies which persons in the household are to have incomes modified as independent variables in computing the tax function.

**TPUL** 

Upper limit for modified variables

#### **DESCRIPTION**

TPUL specifies the upper limit of the independent variable for use in the turning point facility.

**TPVARS** 

Variables to modify [string]

#### **DESCRIPTION**

TPVARS, used in the turning point facility, indicates which variable or variables are to be modified as independent variables to compute the household tax function.

**TUITOPT** 

Tuition deduction/credit option [1=deduction,2=credit]

#### **DESCRIPTION**

This parameter controls the tax treatment of the Tuition Deduction. With a value of 1, the tuition fees (idtuitn) are treated as a deduction from net income and with a value of 2, as a tax credit.

#### **CROSS REFERENCE**

**UIBAFNR** UI EI benefit recovery base amount factor for non-repeaters (EI only)

### **DESCRIPTION**

This parameter is used to calculate UIBRANR. UIBRANR = UIBRA * UIBAFNR.

See UIBRANR and UIEIREPOPT for more information.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

**UIBASOPT** UI reform option [1=normal, 2=Apr'89] (UI and EI)

#### DESCRIPTION

When UIBASOPT is set to 1 then unemployment insurance benefits will be calculated using the UI system as legislated from 1984 through 1989. When UIBASOPT is set to 2 then the proposed reform UI system announced in April 1989 by the Minister of Employment and Immigration, will be used to calculate benefits. The reform involved switching from a regional extended phase to a new schedule of maximum weeks of benefits by regional unemployment rate and number of qualifying weeks. This reform remained in place as part of the EI reforms announced in December 1995.

This parameter applies to UI and EI programs.

This parameter is used to calculate the UI benefit recovery.

When UIEIOPT is equal to 1, a proportion (UIBRP) of net income in excess of this amount or of total benefits is repayable.

When UIEIOPT is equal to 2 and UIEIREPOPT is equal to 1, persons who had more than UIEINRT weeks of previous EI receipt repaid either a proportion of net income in excess of this amount or a proportion of total benefits. Others repaid a proportion of net income in excess of UIBRANR.

When UIEIREPOPT is equal to 2, this parameter is calculated but not used in the program.

This is a derived parameter calculated in mpc.cpp. UIBRA is equal to 52 * UIERNMAX * UIBAF.

This parameter applies to UI and EI programs.

#### **CROSS REFERENCE**

**Function** Description

mpc Calculate derived model parameters and do edits

txinet Compute net income

**UIBRANR** EI repayment base amount for non-repeaters (EI only)

### **DESCRIPTION**

This parameter is used to calculate the EI benefit recovery (clawback). When UIEIREPOPT is set to 1, the recovery depends on previous receipt of EI. For persons who have less than UIEINRT weeks of EI (or who had sickness, maternity, or parental benefits), a proportion of net income in excess of this amount or a proportion of total benefits is repayable. Others repaid a proportion of net income in excess of UIBRA.

When UIEIREPOPT is set to 2, sickness, maternity and parental benefits are exempt from the benefit recovery and UIBRANR is always used in the calculation no matter how many weeks

of EI a person has accumulated.

This is a derived parameter calculated in mpc. It is equal to UIBRA times UIBAFNR.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

### **CROSS REFERENCE**

Function	Description
mpc txinet	Calculate derived model parameters and do edits Compute net income
UIBRP	UI benefit recovery portion (UI only)

### **DESCRIPTION**

If unemployment insurance benefits (imiuib) have been received and net income is in excess of the base amount (UIBRA), this proportion is applied to the lower of (a) total UI benefits and (b) the excess net income, to calculate the repayment which is also a deduction from net income.

This parameter applies only if UIEIOPT is set to 1 (Before the December 1995 reform implemented in 1997)

**UIDEPOPT** UI dependency option [1=normal, 2=Feb'94] (UI only)

### **DESCRIPTION**

When this parameter has a value of 1 then both the income of the UI recipient as well as the number of their dependants will be used to calculate the benefit rate applied to earnings. Under this option the model calculates a variable (imuidpfg) which indicates if the UI applicant has low income and dependants. If the individual has a value of one for this variable then their benefit rate is calculated as follows.

If an individual claimant's earnings are below a given proportion (UIENSRTCO) of UI maximum earnings (UIERNMAX) then the rate used to calculate weekly benefits is taken from the UIENSRATE parameter. If their earnings are above UIENSRTCO proportion of UIERNMAX then the weekly dollar rate if benefits is the higher of

- 1) The benefit rate for the basic phase (UIBASRATE) times average weekly earnings ubern or
- 2) The enhanced rate cutoff (UIENSRTCO) proportion of UI maximum earnings (UIERNMAX) times The enhanced rate for the basic phase (UIENSRATE).

The option corresponds to measures introduced in the 1994 Federal Budget.

With this parameter set to 0 imuidpfg is initialized to zero and the benefit rate applied to earnings is taken from the UIQUIRATE or UIBASRATE parameters.

This parameter applies only in UI programs.

**UIEFFFLAG** Observed effective weekly benefit rate flag (UI and EI)

### **DESCRIPTION**

Flag determines that UI benefits are computed from the average benefit per week observed in sample claims. The effective benefit rate may be higher than 60% of weekly insurable

earnings if special programs were in effect (e.g., job creation) or lower if the sampled claimant reported earnings while on claim.

When the flag is set to 1, the effective weekly benefit rate is used in the calculation of UI benefits. When the flag is set to 0, the modeled weekly benefit rate is used.

This parameter applies in UI and EI program.

**UIEIBRP** 

0

Maximum clawback under EI reform [Past Wks ben][Rate] (EI only)

### **DESCRIPTION**

If employment insurance benefits (imiuib) have been received and net income is in excess of the base amounts (UIBRA) for persons with previous EI receipt or (UIBRANR) for persons with little previous benefits or for persons not on regular EI claims, the repayment is calculated at a rate (UIEIRPR) up to a maximum proportion of total benefit received (UIEIBRP). The rate depends on the previous number of weeks of EI received in the past.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997) and if UIEIREPOPT is set to 1.

**UIEIDIV** EI minimum divisor [uer][divisor] (EI only)

#### DESCRIPTION

Under the minimum divisor rule in EI, the earnings in the past 26 weeks are divided by either the weeks worked or the minimum divisor. This lookup table has the minimum divisor in the left most column and the unemployment rate in the middle column. It is only implemented when UIEIOPT is equal to 2 and UIEIDIVOPT is equal to 2 or 3.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997)

#### CROSS REFERENCE

This parameter allows the user to adjust weekly earnings in order to take into account the minimum devisor rule. If UIEIDIVOPT=1, the minimum divisor rule is not implemented. If UIEIDIVOPT=2 or UIEIDIVOPT=3 the number of weeks worked in the past 26 weeks is estimated to be a proportion (UIWK26) of the number of weeks worked in the past year (ucwwork). The minimum divisor rule is then applied using UIEIDIV. If UIEIDIVOPT=3, a further behavioural response parameter, UIBXWK, allows a proportion of claimants to make up the extra weeks.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997)

**UIEIFIFLG** EI intensity rule exemption for family supplement receivers (EI only)

### **DESCRIPTION**

When UIEIFIFLG is set to 1, claimants receiving a Family Income Supplement are exempt from the Intensity rule.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997)

For more information on the family supplement, see UIEIFSFLG.

#### **UIEIFS1**

Max fam supplement 1 child (EI only)

#### **DESCRIPTION**

When UIEIFSOPT is set to 2, this is the base amount of the family supplement for families with one child. The amount depends on the family's previous year's net income.

For more information on the family supplement, see UIEIFSFLG.

This parameter only applies if UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

### **UIEIFSFLG** UI EI calculate family supplement flag (EI only)

#### DESCRIPTION

When UIEIFSFLG is set to 1, the Family supplement is calculated. The total amount of the family supplement paid on a claim is ubclmfs. The total amount of family supplement paid on a claim in the calendar year is ubcalfs.

The Family Supplement was introduced as part of the Employment Insurance system reform introduced in 1995. It increases the basic benefit of families with low income. It replaces the older program which gave an enhanced rate for individuals with low income (in the SPSD/M this older program was controlled by UIENSRATE, UIDEPOPT, UIENSRTCO).

There are two methods of calculating the Family Supplement. When UIEIFSOPT is set to 1, then family supplement is directly tied into the Canada Child Tax Benefit (imfcben). Families which are eligible for the Child Tax Benefit receive the weekly amount of the benefit in addition to their regular Employment Insurance. It is reduced at a rate (UIEIFSRR) over incomes greater than UIEIFSRL.

Some simplifications were made in order to implement this program in the SPSM. The calculation of the Canada Child Tax Benefit is done after the calculation of EI in the model since it requires net income. But it requires the previous year's net income which is estimated as PYINC times the current year's net income.

When the Family Supplement is activated, the tax/transfer driver (drv) is run through twice per eligible household. The first time, no one will get a family supplement since the child tax benefit is equal to zero. The value of the benefit is saved (in cceopt) and drv is called again. This time, the previously saved value for the child tax benefit is used to calculate the family supplement. The family supplement will be slightly inconsistent with the child tax benefit since the latter will be recalculated and may be slightly smaller than the one used for deriving the family supplement since family net income will increase due to the family supplement.

Another simplification in deriving the family supplement derives from the fact that the SPSM assumes that the Child Tax Benefit is given in one lump sum amount in July. Therefore in the case of the Family supplement, the rules governing the Child Tax Benefit may be a year off if the benefit is received in the first half of the year.

When UIEIFSOPT is set to 2, the family supplement is calculated independently of the child tax benefit. First the number of children under the age of 7 is calculated (imuiydeps). By going through the drv twice, the family's net income (prior to the addition of the family supplement) is available and the previous year's income is derived by multiplying it by PYINC. The family supplement is then derived by looking up the base value (UIEIFS1 for families with 1 child, UIEIFS2 for families with 2 children, and UIEIFS3 for families with 3 or more children). A supplement for each child over and above the third is added (UIEIFSTOPUP) as is a supplement for each child under the age of 7 (UIEIFSYNG).

The Family supplement rules changed on July 1999. Since the methodology under UIEIFSOPT = 1 would be off by a year, it was decided to treat all of 1999 under the methodology introduced in July 1999 (UIEIFSOPT = 2).

Under both options, EI weekly benefits including the family supplement cannot exceed a proportion (UIEIMFSP) of the claimant's weekly earnings (ubern). Nor can EI benefits, including the family supplement exceed the base rate (UIEIRATE) times the maximum weekly earnings (UIERNMAX).

Also, under both programs, when the UIEIFIFLG is turned on, people who receive the family supplement are exempted from the intensity rule.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

**UIEIFSRL** UI EI family supplement reduction level(EI only)

### **DESCRIPTION**

The level of family net income above which the Family Income Supplement is reduced at a rate UIEIFSRR. It is only used when UIEIFSFLG is set to 1, UIEIFSOPT is set to 1, and UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

For more information on the family supplement, see UIEIFSFLG.

**UIEIFSTOPUP** Max fam supplement top up for more than 3 kids (EI only)

### **DESCRIPTION**

When UIEIFSOPT is set to 2, the base amount of the family supplement is increased by this amount for each child over and above the first three. The amount depends on the family's previous year's net income.

For more information on the family supplement, see UIEIFSFLG.

This parameter only applies if UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

### **UIEIHWCF** EI hours to weeks conversion factor (hours/week) (EI only)

### **DESCRIPTION**

In order to calculate the number of weeks of benefits under EI, hours of work are converted to weeks of work using UIEIHWCF, which can then be used in the (UIEWK) array.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997)

## **UIEIMTYPFLG** Flag to model main benefit type (UI and EI)

### **DESCRIPTION**

When UIEIMTYPFLG is turned on, instead of calculating the benefit eligibility and amount using the original claim type (ucbtyp), the main type of claim is used (ucmtyp). Note that when a claim starts with sickness, maternity, or parental benefits and also includes regular benefits (uctpcng), a regular claim is modelled.

THEINDT		
UIEINRT	UI EI No	on repeater level for higher clawback turndown (EI only)

### **DESCRIPTION**

When UIEIREPOPT is equal to 1, the number of weeks of previous EI receipt which makes a recipient qualify for the intensity rule. If a person has less than UIEINRT weeks of EI in the

past, then the intensity rule does not apply and UIBRANR is used to calculate the amount of EI which is repayable. Otherwise, the intensity rule is applied and UIBRA is used in the calculations.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997) and if UIEIREPOPT is set to 1.

**UIEIREF** EI contribution refund cut-in (EI only)

#### DESCRIPTION

If employment income is less than this amount, persons get their EI contributions (imuic) refunded (imuicrf).

Note that in order to get a refund, individuals need to apply for one. In the SPSD/M model, it is assumed that everyone who is entitled to a refund applies. This is probably overstating the case.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

**UIEIREPOPT** EI Benefit repayment option (1=repeaters have higher rate,2=one rate)(EI only)

## **DESCRIPTION**

When EIOPT is equal to 2, then there are two options for calculating the EI benefit recovery (clawback).

When UIEIREPOPT is set to 1, the benefit recovery depends on previous receipt of UI. For

persons who had more than UIEINRT weeks of past EI receipt (ubeiwpd): their recovery was equal to the lesser of :

```
UIEIBRP * their benefits
and
UIEIRPR * (their net income (iminet) – UIBRA).
```

For the rest of the population, and for persons with maternity, sickness, and parental benefits, the recovery was equal to the lesser of:

```
UIEIBRP * their benefits
and
UIEIRPR * (their net income (iminet) – UIBRANR).
```

When UIEIREPOPT is set to 2, persons receiving maternity, sickness, and parental benefits are exempt from the benefit recovery. First time claimants of EI are also exempt. The rest of EI claimants all have the same rules. Their recovery is equal to UIEIRPR times the lesser of their benefits and the amount by which their net income (iminet) exceeds UIBRANR.

**UIEIRPR** UI EI benefit clawback rate (EI only)

#### **DESCRIPTION**

When UIEIREPOPT is set to 1, this rate is used to calculate the EI benefit recovery in the following way. The recovery is equal to the minimum of a person's benefit times a rate (which varies depending on their previous receipt of EI), and this rate (UIEIRPR) times the amount by which a person's net income (iminet) exceeds a turndown (which varies depending on their previous receipt of EI).

When UIEIREPOPT is set to 2, the benefit recovery is equal to this rate (UIEIRPR) times the minimum of the person's benefit and the amount by which a person's net income (iminet) exceeds a turndown (UIEIBRANR).

This parameter applies only if UIEIOPT is set to 2.

For more explanation, se UIEIREPOPT.

**UIEITKP** 

UI EI takeup rate [index]: index based on prov, sex, age, weeks

#### **DESCRIPTION**

Starting in 1995, the estimation of UI/EI benefits showed an increasing gap between SPSD/M results and Statistics Canada data on UI expenditure (annualized D18397). The number of UI/EI beneficiaries showed also the same trend base on an administrative count of the number of UI beneficiaries without counting multiple spells of unemployment. For this version, the takeup rate, UIEITKP, adjust the SPSD/M number of UI/EI beneficiaries by province to the targets provide by administrative data for 1995 and after. For the previous years (1984 to 1994), UIEITKP is set to zero. The following table shows the result of the implementation of UIEITKP.

	UI/EI benefits ('00	00 000 000 \$)	UI/EI beneficiarie	s ('000 000)
	SPSD/M	TARGET	SPSD/M	TARGET
1995	12.6	12.9	2.9	2.9
1996	12.3	12.3	2.8	2.8
1997	11.2	10.9	2.5	2.5

An observation with calculated UI/EI benefits has all its UI/EI calculated variables set to zero if a random number is lower than the value set to UIEITKP. It means all the observations are selected in the years where UIEITKP is set to zero.

# UIEITRNFLAG Modeling of UI training benefits flag (UI and EI)

### **DESCRIPTION**

When this flag is turned on, training benefits are modelled. Under the EI system, training benefits were replaced by new benefit types.

#### **CROSS REFERENCE**

### **DESCRIPTION**

**UIEITRNREGFLG** 

When this flag is turned on and UIEITRNFLAG is turned off, the weeks of training benefits imputed on the database convert to weeks of regular benefits.

UI training benefits turned into regular benefits (UI and EI)

In this version of the database, the following claim types have been assigned "regular" claim status:

Self Employment Assistance Job Creation Partnerships Skills Loans and Grants Targeted Wage Subsidies Targeted Earnings Supplement Support Measures

The year 1996 was a transitional year from UI to EI. There was a half year of training benefits and a half year of its replacements imputed on the database. Therefore by simply turning off training benefits not enough weeks would be included on the database. Turning this flag on helps to overcome transitional year issues.

#### DESCRIPTION

In Employment Insurance, in order to implement the intensity rule and the clawback, the number of weeks of EI benefits received in the past is needed. UIEIYRS is the number of years included in this calculation. If UIEIYRS is equal to 1, only the weeks of benefits in the past year are included. If UIEIYRS is equal to 4, the weeks in the past four years are included. The maximum number of years which can be calculated is 5.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

### **UIENSRATE** Enhanced rate for basic phase (UI only)

#### **DESCRIPTION**

UI claimants may be eligible for a higher benefit rate (UIENSRATE) to be applied to average insured earnings (ubern) if their insured earnings are at or below a set proportion (UIENSRTCO) of maximum insurable earnings (UIERNMAX) and they have dependants.

This measure, introduced in the 1994 Federal budget initially provided for an enhanced rate of 60% compared to a basic rate of 55%.

See also UIDEPOPT, imuidpfg.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

### **UIENSRTCO** Enhanced rate cutoff (UI only)

#### **DESCRIPTION**

UI claimants may be eligible for a higher benefit rate (UIENSRATE) to be applied to average insured earnings (ubern) if their insuerd earnings are at or below a set proportion (UIENSRTCO) of maximum insurable earnings (UIERNMAX) and they have dependants.

This measure, introduced in the 1994 Federal budget initially set qualification requirements that the claimant have insured earnings at or below **half** the Maximum Insurable Earnings.

See also UIDEPOPT, imuidpfg.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

**UIENTFLAG** Basic entrance requirements flag (UI and EI)

### **DESCRIPTION**

When this flag is set to 0 the execution of the uielent sub-function in ui.c is suppressed and all UI claimants are deemed to have a valid claim. When set to 1, eligibility entrance requirement tests in uielent (weeks of work by claim type) are applied.

This parameter applies to UI and EI programs.

**UIEWK** Entitlement (weeks) [wkwrk, uer] (UI and EI)

#### **DESCRIPTION**

This array parameter gives maximum entitlement for the UI system subsequent to the April '89 UI reform. The array has 43 row and 12 columns. Columns represent ranges of local unemployment rate, starting at 6% and increasing to 17%. Rows represent the number of weeks worked prior to claim, starting at 10 weeks and increasing to 52 weeks.

This parameter applies to UI and EI programs.

**UIFSHERMIN** Min. earnings to qualify for fish. benefits [unempl. rate] (EI only)

### **DESCRIPTION**

This parameter represents the minimum earnings in the past 31 weeks which are required to qualify for fishing benefits. They depend on the local unemployment rate (ucuer).

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

### **UIFSHMINWK** Minimum weeks to qualify for fishing benefits (UI only)

#### DESCRIPTION

This parameter represents the minimum weeks of insurable employment in the qualifying period that are required for eligibility for UI fishing benefits. At present, the standard algorithm does not subject fishing claims to an eligibility test.

# **CROSS REFERENCE**

ui Compute UI benefits

### **DESCRIPTION**

Flag which determines whether the labour force extended phase benefits are to be computed (value 1), or not (value 0). This feature of the model permits the program structure to be varied, by deleting a phase.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

**UILFEMIN** Weeks worked in qualifying period [UILFEWKS index] (UI only)

#### DESCRIPTION

The second phase of regular benefits is the Labour Force Extended phase. Additional weeks of benefit entitlement (UILFEWKS) are determined by the weeks of work in the qualifying period (UILFEMIN). These two vectors must always have 14 elements corresponding exactly to each other.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

# **UIREGWKFCT** UI regular benefit weeks adjustment factor (UI and EI)

#### **DESCRIPTION**

This parameter allows the user to increase the claim duration of regular benefits up to the maximum number of eligible weeks. UIREGWKFCT is the proportion of the unused weeks (maximum weeks eligible - actual weeks claimed) that an individual's claim will be extended by. For example, setting UIREGWKFCT to one will set the claim length to the maximum number of eligible weeks.

### **UIREPPREV** Weeks of insurable employment [weeks] (UI only)

#### **DESCRIPTION**

The number of weeks of insurable employment required for repeaters to be eligible for benefits increases with the number of weeks of benefits received in the qualifying period (see also UIREPUER and UIREPWWKD). The vector UIREPPREV must always have 11 elements corresponding to the columns of UIREPWWKD.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

**UIREPUER** Regional unemployment rate [rates] (UI only)

#### **DESCRIPTION**

The number of weeks of insurable employment required for repeaters to be eligible for benefits decreases at progressively higher regional unemployment rates (see also UIREPPREV and UIREPWWKD). The vector UIREPUER must always have 5 elements corresponding to the rows of UIREPWWKD.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

**UIREPWWKD** Repeater eligibility requirements [weeks x rates] (UI only)

#### **DESCRIPTION**

The number of weeks of insurable employment required for repeaters to be eligible for benefits increases with the number of weeks of benefits received in the qualifying period (UIREPPREV) and decreases at progressively higher regional unemployment rates (UIREPUER). UIREPWWKD represents a two dimensional (11 by 5) lookup table of the weeks of work required for repeater eligibility.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

# **UIRGEFLAG** Regional extended phase calculation flag (UI only)

### **DESCRIPTION**

Flag which determines whether the regional extended phase benefits are to be computed (value 1), or not (value 0). This feature of the model permits the program structure to be varied, by deleting a phase.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

**UIRGEMIN** Unemployment rate for Regional Extended entitlement [UIRGEWKS index] (UI only)

#### DESCRIPTION

The third phase of regular benefits is the Regional Extended phase. Additional weeks of benefit entitlement are determined by the regional unemployment rate (see UIRGEWKS). Cut-points represent the lower bound of class intervals (the lowest possible unemployment rate is coded as -1.0). The vectors UIRGEMIN and UIRGEWKS must always have 17 elements corresponding exactly to each other.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

# **UIRGERATE** Benefit rate for regional extended phase (UI only)

#### **DESCRIPTION**

Benefit rate as a proportion of weekly insurable earnings. This parameter is not used if the flag UIEFFFLAG is set to 0.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

### **UIRGNFLAG** Regional requirements flag (UI only)

#### **DESCRIPTION**

Flag which determines whether variable UI entrance requirements based on regional unemployment rates are used (value 1), or not (value 0).

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform

# **CROSS REFERENCE**

Function Description

#### DESCRIPTION

The UIRGNWKS parameter represents the number weeks of insurable employment in the qualifying period that are required for regular benefits in relation to the unemployment rate of UI economic regions.

Eligibility is finally determined by comparing weeks of insurable employment in the qualifying period (UIRGNWKS) to the level required in relation to local (UI Economic Region) unemployment rates. Cut points for unemployment rates are given as lower bounds (the minimum possible unemployment rate is coded as -1.0). The vectors UIRGNMIN and UIRGNWKS must always have 5 elements corresponding exactly to each other.

This parameter applies only if UIEIOPT is set to 1 (Before December 1995 reform implemented in 1997).

### **UITARGET** UI/EI target for the number of cases (UI and EI)

#### **DESCRIPTION**

Users can increase or decrease the number of Unemployment/Employment Insurace (UI) by increasing or decreasing UITARGET.

Interval between 0.5 and 0.95 allows for a maximum increase of 3% in the number of UI recipients. Interval between 0.05 and 0.5 allows for a maximum decrease of 3% in the number of UI recipients. Individuals are selected and get UI history when iduirank/1000 is lower than UITARGET.

See iduipred, iduirank.

For more information on using this facility, see the  $\underline{\textit{User's Guide}}$  under Miscellaneous Facilities.

#### **UITARGYRMAX**

Maximum insurable earnings for target year

#### **DESCRIPTION**

The maximum weekly earnings insurable under the provisions of the UI program for the target year. The value defined by the UI ACT is updated annually in relation to a moving average of earnings determined from Revenue Canada data.

This parameter applies to UI and EI programs.

### **UITRNBNFCT** UI training benefit per week adjustment factor (EI and EI)

#### DESCRIPTION

This parameter allows the user to increase the dollar amount of training benefits for all recipients of training benefits by up to twice the actual amount. The actual training benefit (uctrnbr) is multiplied by the factor UITRNBNFCT plus one(1). For example, setting UITRNWKFCT to one will result in the amount of training benefits to be multiplied by 2; a factor of .5 would result in benefits being multiplied by 1.5.

This parameter applies to UI and EI programs.

#### **DESCRIPTION**

This parameter allows the user to increase the claim duration of training benefits for all recipients of training benefits by up to twice the actual number of weeks on training. The actual training weeks (uctrnwk) are multiplied by the factor UITRNWKFCT plus one (1). For example, setting UITRNWKFCT to one will result in the number of weeks of training benefits to be multiplied by 2; a factor of .5 would result in weeks being multiplied by 1.5.

This parameter applies to UI and EI programs.

UIWK26

Conversion rate of weeks worked (52 to 26 weeks) [prob][rate] (EI only)

#### **DESCRIPTION**

This represents the proportion of weeks worked in the past year which were worked in the past 26 weeks. It is used to calculate the minimum divisor rule (UIEIDIV) and is only in effect when UIEIOPT is equal to 2 and UIEIDIVOPT is equal to 2 or 3.

It is set up as a lookup table with the proportions in the left most column, and probability distribution (0-100) in the middle column. A random number is called in the program, and the proportion of weeks worked in the past 26 weeks is then derived.

If the parameter is set to one, then it is assumed that all the weeks happened immediately prior to the receipt of EI.

This parameter applies only if UIEIOPT is set to 2 (December 1995 reform implemented in 1997).

## **UPDATEINT** Interval between screen updates (hhlds)

## **DESCRIPTION**

The UPDATEINT parameter controls how often SPSM will update its progress display during the simulation phase. Specifically, it specifies the number of households to simulate between updates of the SPSM progress indicator. If UPDATEINT is set to 0, an appropriate default value will be assigned to UPDATEINT. If UPDATEINT is set to a low value, considerable time may be spent updating the display in the Windows version of SPSM.

The default value for UPDATEINT is 1000.

### **UVAR** User statements [string]

#### DESCRIPTION

The UVAR control parameter contains a list (string) of SPSM statements that create and assign the user variables. See the *User's Guide* for details.

#### **UVARFLAG** Activate UVAR parameter for expressions

### **DESCRIPTION**

This control parameter, when set to 1, activates the UVAR parameter of the user variable facility. The User Variable Facility allows the creation of new user-defined variables, whose values are created through SPSM statements. See the <u>User's Guide</u> for details.

**VAMTOPT** N.S. alternative minimum tax option (1=none, 2=% fed, 3=fed adjusted net income)

#### DESCRIPTION

When Nova Scotia tax on taxable income is calculated (VTXFLG = 1), there are three options as to how to calculate the provincial minimum tax.

When VAMTOPT is set to 1, then no provincial alternative minimum tax is calculated.

When VAMTOPT is set to 2, then a percentage (VAMTPCTF) of the additional federal tax due to the minimum tax is added to the basic provincial tax (imbpt).

When VAMTOPT is set to 3, the income used in the provincial tax calculation is replaced by the net income used for alternative tax purposes (imamtinc) for people who triggered the federal minimum tax. Then the VAMTTX rate, usually set to the smallest non-zero tax rate, is applied in order to get the provincial tax before the non-refundable tax credits.

**VAMTPCTF** N.S. amt rate as pct of additional fed tax due to minimum tax

## **DESCRIPTION**

When Nova Scotia tax on taxable income is calculated (VTXFLG=1) and VAMTOPT is set to 2, then a percentage (VAMTPCTF) of the additional federal tax due to the minimum tax

is added to the basic provincial tax (imbpt).

### **VARALG** Name of variant algorithm [string]

#### **DESCRIPTION**

This control parameter is automatically generated by SPSM, and records the overall name of the tax/transfer algorithm used to generate variant results.

**VARDESC** Description of variant parameters [string]

#### **DESCRIPTION**

This control parameter is automatically generated by SPSM, and is simply a copy of the MPRDESC parameter of the variant. The value will appear in the page header of the output table file.

### **VARMETH** Method of creating variant variables

#### **DESCRIPTION**

This parameter specifies one of three methods for producing variant results. Valid values are:

- 0. No variant results will be calculated
- 2. Results will be calculated using the standard algorithm with tax/transfer parameters as specified in the INPVARMPR file.
- 3. Results will be calculated using the alternate algorithm with tax/transfer parameters specified in the INPVARMPR file.

The default value for VARMETH is 2.

VAXM N.S. Age Amount

#### DESCRIPTION

This is the maximum value of the Nova Scotia age non-refundable tax credit before any

reductions are applied. The parameter is only used when a provincial tax on taxable income is calculated (VTXFLG = 1).

VCBBAS1 NS child benefit for first child

### **DESCRIPTION**

This is the amount of Nova Scotia Child Benefit received for the first child. The benefit is turned on by the flag VCBFLG, and families whose net income is less than VCBTD are eligible. They receive VCBBAS1 for their first child, VCBBAS2 for their second child, and VCBBAS3 for their third and each additional child. The benefit is assigned to the mother if present.

## VCBBAS2 NS child benefit for second child

## **DESCRIPTION**

This is the amount of Nova Scotia Child Benefit received for the second child. The benefit is turned on by the flag VCBFLG, and families whose net income is less than VCBTD are eligible. They receive VCBBAS1 for their first child, VCBBAS2 for their second child, and VCBBAS3 for their third and each additional child. The benefit is assigned to the mother if

present.

# VCGTC N.S. Caregiver Tax Credit

## **DESCRIPTION**

VCGTC multiplied by VPNTCR is the maximum amount of the Nova Scotia Caregiver Tax Credit (impcgtc). The parameter is only used when the provincial tax on taxable income is calculated (VTXFLG = 1).

For more explanation see VCGTCFLG.

The calculation of the Nova Scotia Caregiver Tax Credit (impcgtc) is activated by the flag VCGTCFLG.

The Caregiver Tax Credit (impcgtc) provides additional tax assistance to individuals who provide in-home care for relatives. Eligible recipients include individuals residing with and providing in-home care for a parent or grandparent over 65 years of age, or for an infirm dependent relative.

This variable is the sum of modelled Caregiver Tax Credits for all dependants other than spouse. (Line 315 and Schedule 12 in the General Tax Guide)

The base level of the credit is VCGTC. Based on the results of a study pertaining to the presence of elderly parents within the economic family, a take-up rate VCGTCTC was determined. The take up rate is based on the age of a potential parent, assigned to individuals with idefrh =3, according to SCF data. Users have access to a take-up rate VCGTCTK based on employment income to select the appropriate number of beneficiaries.

The benefit, impcgtc, is reduced for each dollar of net income, iminet, in excess of VCGTCTD.

This non-refundable tax credit is only calculated when the provincial tax on taxable income is calculated (VTXFLG = 1).

**VCGTCTC** N.S. Caregiver tax credit take-up rate by age of elderly [age,rate]

#### **DESCRIPTION**

This is the first take-up rate used in the calculation of Nova Scotia's impogtc. It selects an individual with idefrh = 3 and assign him/her as a parent according to observed probability in SCF. The probability is also based on idage.

The parameter is only used when the provincial tax on taxable income is calculated (VTXFLG = 1).

#### **VDACB**

NS Direct assistance benefit for couples

#### **DESCRIPTION**

This parameter is the amount of Direct Assistance (iminsda) a family with income less than VDACI would receive.

Beginning in 2000, the Nova Scotia Direct Assistance will only be granted to families with children when VDAFWC is activated.

See also VDACB.

When this parameter is set to 1, the Nova Scotia Direct Assistance Benefit is only granted to families with children. This amendment to the Direct Assistance Program was announced in the Nova Scotia 2000 Budget. When this flag is activated, the benefit is targeted to low-income working families whose income is below VDASI for lone parent families and VDACI for couples with children. The maximum benefit per family is VDACB.

**VEMXMT** N.S. equivalent to married turndown level

#### **DESCRIPTION**

This parameter represents the provincial equivalent to married exemption turndown when Nova Scotia tax is calculated as a tax on taxable income. It is only used when VTXFLG is set to 1. The reduction is calculated as the dependant's net income less the turndown VEMXMT.

**VPHOPT** Nova Scotia pharmacare premium option (1=GIS, 2=income)

#### DESCRIPTION

When this parameter is set to 1, the Pharmacare tax credit is available to all seniors age 65 and over who are in receipt of GIS. When it is set to 2, the credit is available to all seniors but is reduced when family income is greater than VPHTD for singles and VPHTDC for couples. The refundable tax credit was introduced in the 1995 Nova Scotia budget, and was modified in 1996.

Changes were made to the Nova Scotia Pharmacare program in 1999. The premium is waived for seniors on Guaranteed Income Supplement and may be reduced for other seniors with low-income. The refundable tax credit was also eliminated.

### **VPHPREM** Nova Scotia pharmacare premium

### **DESCRIPTION**

This parameter gives the amount of the Nova Scotia Pharmacare premium. The premium is an annual head tax on all seniors age 65 and over. The premium was introduced in the 1995 Nova Scotia budget.

Changes were made to the Nova Scotia Pharmacare program in 1999. The premium is waived for seniors on Guaranteed Income Supplement and may be reduced for other seniors with low-income. The refundable tax credit was also eliminated.

VPHRR	Nova Scotia	a pharmacare tax credit reduction rate

### **DESCRIPTION**

This parameter gives the amount of the Nova Scotia Pharmacare premium tax credit reduction rate. This is the proportion of income (imgisinc) above the turndown (VPHTD or VPHTDC) which will be subtracted from the Maximum Pharmacare Tax Credit (VPHTC) to determine the allowable amount of the tax credit. The refundable tax credit was introduced in the 1995 Nova Scotia budget.

Changes were made to the Nova Scotia Pharmacare program in 1999. The premium is waived for seniors on Guaranteed Income Supplement and may be reduced for other seniors with low-income. The refundable tax credit was also eliminated.

**VPHTD** Nova Scotia pharmacare tax credit turndown

#### **DESCRIPTION**

When VPHOPT is set to 1, this parameter gives the amount of the Nova Scotia Pharmacare premium tax credit turndown. When VPHOPT is set to 2, this is the turndown for singles (for couples it is VPHTDC). The turndown represents the level of income above which the Nova Scotia Pharmacare refundable tax credit begins to be reduced. The income used is imgisinc when VPHOPT is set to 1, and family income (imitot + imisa + imigis + imispa) otherwise. The refundable tax credit was introduced in the 1995 Nova Scotia budget.

Changes were made to the Nova Scotia Pharmacare program in 1999. The premium is waived for seniors on Guaranteed Income Supplement and may be reduced for other seniors with low-income. The refundable tax credit was also eliminated.

### **VPNTCR** N.S. provincial non-refundable tax credit rate

### **DESCRIPTION**

This single parameter sets the tax credit rate for all of the non-refundable tax credits in Nova Scotia. Each tax credit is calculated separately and summed for a total credit. The parameter is only used when a provincial tax on taxable income is calculated (VTXFLG = 1).

**VPTC** 

Nova Scotia political contribution table [total donations,donation allowed]

### **DESCRIPTION**

This table contains the figures necessary to calculate the Nova Scotia Political Contribution Tax Credit. The first column represents the dollar amount of total Nova Scotia political

contributions to which the corresponding percentages of the third column are applied to calculate the total Allowable Nova Scotia Political Contribution Tax Credit. Only the first and third columns of the table need to be specified.

**VPTX** 

This table represents the Nova Scotia tax curve used when calculating the tax on taxable income (VTXFLG = 1). The first column represents Taxable Income, the second represents the amount of Basic Provincial Tax payable at that level of taxable income, the third column represents the marginal tax rate for the interval between this and the next value in the table.

N.S. tax table [taxable income,basic provincial tax]

Only the first and third columns of the tax table need be specified. The second column is computed by the standard algorithm.

**VSCI** 

Nova Scotia provincial tax above which surtax applies

#### **DESCRIPTION**

This is the level of provincial tax payable (imtxp) above which a surtax at the rate of VSF applies.

For Nova Scotia, the SPSM calculates provincial surtax (impsur) as VSF percent of provincial taxes (imtxp) above the level VSCI plus VSF2 percent of provincial taxes above the level VSCI2.

VTRTD	Nova Scotia ta	x reduction fami	ily income turndown

### **DESCRIPTION**

This parameter gives the amount of the Nova Scotia tax reduction turndown. This is the level of family net income above which the Nova Scotia tax reduction begins to be reduced. The income is iminet.

### **CROSS REFERENCE**

txns Compute provincial taxes for Nova Scotia

#### **WGTFLAG** Read weight file

#### **DESCRIPTION**

This parameter is usually left at 1. If de-activated, the weight file specified in the parameter INPWGT (if any) will not be read, and all weights will instead be set to the value 1.0. This facility can be used to produce unweighted tabulations of SPSD, and is also useful if `hypothetical households' generated using the bldspd utility are being used instead of the supplied SPSD.

**WGTTOT** Sum of weights on tax file

#### **DESCRIPTION**

This control parameter specifies the total sum of weights on the input weight file. This value is generated by SPSM automatically and is reproduced here for informational purposes.

**WSCF** CPP/QPP contribution rate on employment earnings

#### DESCRIPTION

In the calculation of CPP contributions, this is the rate applied to earnings from employment.

#### **XTCOLS** X-tab desired print width

#### **DESCRIPTION**

This control parameter, when activated by XTFLAG, specifies the width desired for table reports. It is used to improve the appearance of tables, but does not guarantee that the table will fit within the bounds specified. Please see the <u>User's Guide</u> for more information.

The default value for XTCOLS is 132.

#### **XTDBLFLAG** X-tab double precision activation flag

#### DESCRIPTION

This control parameter, when set to 1 and activated by XTFLAG, specifies that calculations for table reports will be performed with double precision, otherwise single precision will be used. Please see the <u>User's Guide</u> for more information.

The default value for XTDBLFLAG is 1.

This control parameter activates the SPSM cross tabulation facility. The cross-tabulation facility allows the user to generate multidimensional tables of his or her own design. Please see the *User's Guide* for more information.

**XTLINES** 

X-tab desired lines per page

#### **DESCRIPTION**

This control parameter, when activated by XTFLAG, specifies the number of lines per page available on the user's output device. It is used to pack tables onto pages efficiently, but cannot be used to split tables with many lines across pages in a sensibly formatted fashion. Please see the *User's Guide* for more information.

The default value for XTLINES is 66.

**XTSPEC** 

X-tab specification [string]

#### **DESCRIPTION**

This control parameter, when activated by XTFLAG, specifies the tables requested by the user. As the syntax of table specification is rather complicated, please see the <u>User's Guide</u> for more information.

**YCXM** 

Dependent child exemption

#### **DESCRIPTION**

If the parameter PEROPT is set to 1 (for personal exemptions), each wholly dependent child under the age of 18 may be claimed for an exemption of this amount, subject to reductions based on the child's net income.

#### YINDL Maximum interest and dividend income deduction

#### **DESCRIPTION**

Interest and dividend income exclusive of carrying charges, and, optionally, taxable capital gains (depending upon the setting of the parameter CGIFLAG) are eligible to be claimed for the Interest and Dividend Income Deduction. This parameter determines the maximum possible deduction. If YINDL is set to 0, the value of the deduction is zero.
