Note to users of the Block-face Data File

Since the release of the 1996 Block-face Data File in February 1998, errors have been detected in the location of some block-face representative points. These errors have been corrected and a replacement copy of the product is available to all purchasers.

The Block-face Data File contains 827,933 records, with 810,412 representing a block-face (typically one side of a city street between intersections). The remaining 17,521 records indicate the location of the enumeration area representative point for households that could not be linked to a specific block-face.

A total of 44,484 block-face representative points were incorrectly located in the first version of the file. Only the latitude/latitude co-ordinates were in error. The erroneous co-ordinates for these block-faces coincided with the location of the enumeration area representative point, rather than the representative point of the block-face itself. No other fields were modified.

The following table provides a breakdown of the corrected records by Census Metropolitan Area / Census Agglomeration:
